

genes which GAM2179 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30387] Nucleotide sequences of the GAM2179 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2179 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2179 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2179 are further described hereinbelow with reference to Table 1.

[30388] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2179 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30389] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2180 (GAM2180) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30390] GAM2180 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2180 was detected is described hereinabove with reference to Figs. 2-8.

[30391] GAM2180 gene, herein designated GAM GENE, and GAM2180 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[30392] GAM2180 gene, herein designated GAM GENE, encodes a GAM2180 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2180 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2180 precursor RNA is designated SEQ ID:2157, and is provided hereinbelow with reference to the sequence listing part.

[30393] GAM2180 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30394] An enzyme complex designated DICER COMPLEX, dices the GAM2180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2180 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM2180 RNA is designated SEQ ID:4771, and is provided

hereinbelow with reference to the sequence listing part.

[30395] GAM2180 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2180 target RNA, herein designated GAM TARGET RNA. GAM2180 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30396] GAM2180 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2180 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2180 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2180 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2180 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30397] The complementary binding of GAM2180 RNA, herein designated GAM RNA, to target binding sites on GAM2180 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2180 target RNA, herein designated GAM TARGET RNA, into GAM2180 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30398] It is appreciated that GAM2180 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2180 target genes. The mRNA of each one of this plurality of GAM2180 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2180 RNA, herein designated GAM RNA, and which when bound by GAM2180 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2180 target proteins.

[30399] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2180 gene, herein designated GAM GENE, on one or more GAM2180 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30400] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2180 correlate with, and may be deduced from, the identity of the target genes which GAM2180 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30401] Nucleotide sequences of the GAM2180 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2180 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2180 are further described hereinbelow with reference to Table 1.

[30402] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2180 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30403] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2181 (GAM2181) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30404] GAM2181 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2181 was detected is described hereinabove with reference to Figs. 2-8.

[30405] GAM2181 gene, herein designated GAM GENE, and GAM2181 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30406] GAM2181 gene, herein designated GAM GENE, encodes a GAM2181 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2181 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2181 precursor RNA is designated SEQ ID:2158, and is provided hereinbelow with reference to the sequence listing part.

[30407] GAM2181 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30408] An enzyme complex designated DICER COMPLEX, dices the GAM2181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2181 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM2181 RNA is designated SEQ ID:4772, and is provided hereinbelow with reference to the sequence listing part.

[30409] GAM2181 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2181 target RNA, herein designated GAM TARGET RNA. GAM2181 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30410] GAM2181 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2181 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2181 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2181 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2181 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30411] The complementary binding of GAM2181 RNA, herein designated GAM RNA, to target binding sites on GAM2181 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2181 target RNA, herein designated GAM TARGET RNA, into GAM2181 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30412] It is appreciated that GAM2181 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2181 target genes. The mRNA of each one of this plurality of GAM2181 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2181 RNA, herein designated GAM RNA, and which when bound by GAM2181 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2181 target proteins.

[30413] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2181 gene, herein designated GAM GENE, on one or more GAM2181 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30414] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2181 correlate with, and may be deduced from, the identity of the target genes which GAM2181 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30415] Nucleotide sequences of the GAM2181 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2181 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2181 are further described hereinbelow with reference to Table 1.

[30416] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2181 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30417] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2182 (GAM2182) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30418] GAM2182 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2182 was detected is described hereinabove with reference to Figs. 2-8.

[30419] GAM2182 gene, herein designated GAM GENE, and GAM2182 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30420] GAM2182 gene, herein designated GAM GENE, encodes a GAM2182 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2182 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2182 precursor RNA is designated SEQ ID:2159, and is provided hereinbelow with reference to the sequence listing part.

[30421] GAM2182 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2182 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [30422] An enzyme complex designated DICER COMPLEX, dices the GAM2182 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2182 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2182 RNA is designated SEQ ID:4773, and is provided hereinbelow with reference to the sequence listing part.
- [30423] GAM2182 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2182 target RNA, herein designated GAM TARGET RNA. GAM2182 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [30424] GAM2182 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2182 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2182 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2182 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2182 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30425] The complementary binding of GAM2182 RNA, herein designated GAM RNA, to target binding sites on GAM2182 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2182 target RNA, herein designated GAM TARGET RNA, into GAM2182 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30426] It is appreciated that GAM2182 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2182 target genes. The mRNA of each one of this plurality of GAM2182 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2182 RNA, herein designated GAM RNA, and which when bound by GAM2182 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2182 target proteins.

[30427] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2182 gene, herein designated GAM GENE, on one or more GAM2182 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30428] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2182 correlate with, and may be deduced from, the identity of the target genes which GAM2182 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30429] Nucleotide sequences of the GAM2182 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2182 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2182 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2182 are further described hereinbelow with reference to Table 1.

[30430] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2182 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[30431] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2183 (GAM2183) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30432] GAM2183 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2183 was detected is described hereinabove with reference to Figs. 2-8.

[30433] GAM2183 gene, herein designated GAM GENE, and GAM2183 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30434] GAM2183 gene, herein designated GAM GENE, encodes a GAM2183 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2183 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2183 precursor RNA is designated SEQ ID:2160, and is provided hereinbelow with reference to the sequence listing part.

[30435] GAM2183 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30436] An enzyme complex designated DICER COMPLEX, dices the GAM2183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2183 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2183 RNA is designated SEQ ID:4774, and is provided hereinbelow with reference to the sequence listing part.

[30437] GAM2183 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2183 target RNA, herein designated GAM TARGET RNA. GAM2183 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30438] GAM2183 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2183 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2183 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2183 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2183 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30439] The complementary binding of GAM2183 RNA, herein designated GAM RNA, to target binding sites on GAM2183 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2183 target RNA, herein designated GAM TARGET RNA, into GAM2183 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30440] It is appreciated that GAM2183 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2183 target genes. The mRNA of each one of this plurality of GAM2183 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2183 RNA, herein designated GAM RNA, and which when bound by GAM2183 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2183 target proteins.

[30441] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2183 gene, herein designated GAM GENE, on one or more GAM2183 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30442] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2183 correlate with, and may be deduced from, the identity of the target genes which GAM2183 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30443] Nucleotide sequences of the GAM2183 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2183 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2183 are further described hereinbelow with reference to Table 1.

- [30444] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2183 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [30445] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2184 (GAM2184) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [30446] GAM2184 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2184 was detected is described hereinabove with reference to Figs. 2-8.
- [30447] GAM2184 gene, herein designated GAM GENE, and GAM2184 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [30448] GAM2184 gene, herein designated GAM GENE, encodes a GAM2184 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2184 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2184 precursor RNA is designated SEQ ID:2161, and is provided hereinbelow with reference to the sequence listing part.

[30449] GAM2184 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2184 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30450] An enzyme complex designated DICER COMPLEX, dices the GAM2184 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2184 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2184 RNA is designated SEQ ID:4775, and is provided hereinbelow with reference to the sequence listing part.

[30451] GAM2184 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2184 target RNA, herein designated GAM TARGET RNA. GAM2184 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30452] GAM2184 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2184 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2184 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2184 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2184 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30453] The complementary binding of GAM2184 RNA, herein designated GAM RNA, to target binding sites on GAM2184 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2184 target RNA, herein designated GAM TARGET RNA, into GAM2184 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30454] It is appreciated that GAM2184 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2184 target genes. The

mRNA of each one of this plurality of GAM2184 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2184 RNA, herein designated GAM RNA, and which when bound by GAM2184 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2184 target proteins.

[30455] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2184 gene, herein designated GAM GENE, on one or more GAM2184 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30456] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2184 correlate with, and may be deduced from, the identity of the target genes which GAM2184 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30457] Nucleotide sequences of the GAM2184 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2184 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2184 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2184 are further described hereinbelow with reference to Table 1.

[30458] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2184 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30459] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2185 (GAM2185) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30460] GAM2185 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2185 was detected is described hereinabove with reference to Figs. 2-8.

[30461] GAM2185 gene, herein designated GAM GENE, and GAM2185 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30462] GAM2185 gene, herein designated GAM GENE, encodes a GAM2185 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2185 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2185 precursor RNA is designated SEQ ID:2162, and is provided hereinbelow with reference to the sequence listing part.

[30463] GAM2185 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2185 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30464] An enzyme complex designated DICER COMPLEX, dices the GAM2185 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2185 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2185 RNA is designated SEQ ID:4776, and is provided hereinbelow with reference to the sequence listing part.

[30465] GAM2185 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2185 target RNA, herein designated GAM TARGET RNA. GAM2185 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30466] GAM2185 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2185 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2185 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2185 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2185 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30467] The complementary binding of GAM2185 RNA, herein designated GAM RNA, to target binding sites on GAM2185 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2185 target RNA, herein designated GAM TARGET RNA, into GAM2185 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30468] It is appreciated that GAM2185 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2185 target genes. The mRNA of each one of this plurality of GAM2185 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2185 RNA, herein designated GAM RNA, and which when bound by GAM2185 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2185 target proteins.

[30469] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2185 gene, herein designated GAM GENE, on one or more GAM2185 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30470] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2185 correlate with, and may be deduced from, the identity of the target

genes which GAM2185 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30471] Nucleotide sequences of the GAM2185 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2185 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2185 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2185 are further described hereinbelow with reference to Table 1.

[30472] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2185 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30473] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2186 (GAM2186) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30474] GAM2186 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2186 was detected is described hereinabove with reference to Figs. 2-8.

[30475] GAM2186 gene, herein designated GAM GENE, and GAM2186 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[30476] GAM2186 gene, herein designated GAM GENE, encodes a GAM2186 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2186 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2186 precursor RNA is designated SEQ ID:2163, and is provided hereinbelow with reference to the sequence listing part.

[30477] GAM2186 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30478] An enzyme complex designated DICER COMPLEX, dices the GAM2186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2186 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM2186 RNA is designated SEQ ID:4777, and is provided

hereinbelow with reference to the sequence listing part.

[30479] GAM2186 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2186 target RNA, herein designated GAM TARGET RNA. GAM2186 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30480] GAM2186 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2186 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2186 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2186 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2186 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30481] The complementary binding of GAM2186 RNA, herein designated GAM RNA, to target binding sites on GAM2186 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2186 target RNA, herein designated GAM TARGET RNA, into GAM2186 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30482] It is appreciated that GAM2186 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2186 target genes. The mRNA of each one of this plurality of GAM2186 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2186 RNA, herein designated GAM RNA, and which when bound by GAM2186 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2186 target proteins.

[30483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2186 gene, herein designated GAM GENE, on one or more GAM2186 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30484] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2186 correlate with, and may be deduced from, the identity of the target genes which GAM2186 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30485] Nucleotide sequences of the GAM2186 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2186 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2186 are further described hereinbelow with reference to Table 1.

[30486] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2186 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30487] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2187 (GAM2187) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30488] GAM2187 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2187 was detected is described hereinabove with reference to Figs. 2-8.

[30489] GAM2187 gene, herein designated GAM GENE, and GAM2187 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30490] GAM2187 gene, herein designated GAM GENE, encodes a GAM2187 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2187 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2187 precursor RNA is designated SEQ ID:2164, and is provided hereinbelow with reference to the sequence listing part.

[30491] GAM2187 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30492] An enzyme complex designated DICER COMPLEX, dices the GAM2187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2187 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2187 RNA is designated SEQ ID:4778, and is provided hereinbelow with reference to the sequence listing part.

[30493] GAM2187 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2187 target RNA, herein designated GAM TARGET RNA. GAM2187 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30494] GAM2187 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2187 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2187 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2187 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2187 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30495] The complementary binding of GAM2187 RNA, herein designated GAM RNA, to target binding sites on GAM2187 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2187 target RNA, herein designated GAM TARGET RNA, into GAM2187 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30496] It is appreciated that GAM2187 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2187 target genes. The mRNA of each one of this plurality of GAM2187 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2187 RNA, herein designated GAM RNA, and which when bound by GAM2187 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2187 target proteins.

[30497] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2187 gene, herein designated GAM GENE, on one or more GAM2187 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30498] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2187 correlate with, and may be deduced from, the identity of the target genes which GAM2187 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30499] Nucleotide sequences of the GAM2187 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2187 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2187 are further described hereinbelow with reference to Table 1.

[30500] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2187 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30501] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2188 (GAM2188) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30502] GAM2188 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2188 was detected is described hereinabove with reference to Figs. 2-8.

[30503] GAM2188 gene, herein designated GAM GENE, and GAM2188 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30504] GAM2188 gene, herein designated GAM GENE, encodes a GAM2188 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2188 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2188 precursor RNA is designated SEQ ID:2165, and is provided hereinbelow with reference to the sequence listing part.

[30505] GAM2188 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30506] An enzyme complex designated DICER COMPLEX, dices the GAM2188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2188 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2188 RNA is designated SEQ ID:4779, and is provided hereinbelow with reference to the sequence listing part.

[30507] GAM2188 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2188 target RNA, herein designated GAM TARGET RNA. GAM2188 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30508] GAM2188 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2188 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2188 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2188 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2188 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30509] The complementary binding of GAM2188 RNA, herein designated GAM RNA, to target binding sites on GAM2188 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2188 target RNA, herein designated GAM TARGET RNA, into GAM2188 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30510] It is appreciated that GAM2188 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2188 target genes. The mRNA of each one of this plurality of GAM2188 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2188 RNA, herein designated GAM RNA, and which when bound by GAM2188 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2188 target proteins.

[30511] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2188 gene, herein designated GAM GENE, on one or more GAM2188 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30512] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2188 correlate with, and may be deduced from, the identity of the target genes which GAM2188 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30513] Nucleotide sequences of the GAM2188 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2188 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2188 are further described hereinbelow with reference to Table 1.

[30514] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2188 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[30515] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2189 (GAM2189) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30516] GAM2189 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2189 was detected is described hereinabove with reference to Figs. 2-8.

[30517] GAM2189 gene, herein designated GAM GENE, and GAM2189 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30518] GAM2189 gene, herein designated GAM GENE, encodes a GAM2189 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2189 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2189 precursor RNA is designated SEQ ID:2166, and is provided hereinbelow with reference to the sequence listing part.

[30519] GAM2189 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30520] An enzyme complex designated DICER COMPLEX, dices the GAM2189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2189 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2189 RNA is designated SEQ ID:4780, and is provided hereinbelow with reference to the sequence listing part.

[30521] GAM2189 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2189 target RNA, herein designated GAM TARGET RNA. GAM2189 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30522] GAM2189 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2189 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2189 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2189 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2189 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30523] The complementary binding of GAM2189 RNA, herein designated GAM RNA, to target binding sites on GAM2189 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2189 target RNA, herein designated GAM TARGET RNA, into GAM2189 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30524] It is appreciated that GAM2189 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2189 target genes. The mRNA of each one of this plurality of GAM2189 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2189 RNA, herein designated GAM RNA, and which when bound by GAM2189 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2189 target proteins.

[30525] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2189 gene, herein designated GAM GENE, on one or more GAM2189 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30526] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2189 correlate with, and may be deduced from, the identity of the target genes which GAM2189 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30527] Nucleotide sequences of the GAM2189 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2189 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2189 are further described hereinbelow with reference to Table 1.

[30528] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2189 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30529] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2190 (GAM2190) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30530] GAM2190 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2190 was detected is described hereinabove with reference to Figs. 2-8.

[30531] GAM2190 gene, herein designated GAM GENE, and GAM2190 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30532] GAM2190 gene, herein designated GAM GENE, encodes a GAM2190 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2190 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2190 precursor RNA is designated SEQ ID:2167, and is provided hereinbelow with reference to the sequence listing part.

[30533] GAM2190 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30534] An enzyme complex designated DICER COMPLEX, dices the GAM2190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2190 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2190 RNA is designated SEQ ID:4781, and is provided hereinbelow with reference to the sequence listing part.

[30535] GAM2190 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2190 target RNA, herein designated GAM TARGET RNA. GAM2190 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30536] GAM2190 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2190 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2190 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2190 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2190 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30537] The complementary binding of GAM2190 RNA, herein designated GAM RNA, to target binding sites on GAM2190 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2190 target RNA, herein designated GAM TARGET RNA, into GAM2190 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30538] It is appreciated that GAM2190 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2190 target genes. The

mRNA of each one of this plurality of GAM2190 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2190 RNA, herein designated GAM RNA, and which when bound by GAM2190 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2190 target proteins.

[30539] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2190 gene, herein designated GAM GENE, on one or more GAM2190 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30540] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2190 correlate with, and may be deduced from, the identity of the target genes which GAM2190 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30541] Nucleotide sequences of the GAM2190 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2190 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2190 are further described hereinbelow with reference to Table 1.

[30542] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2190 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30543] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2191 (GAM2191) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30544] GAM2191 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2191 was detected is described hereinabove with reference to Figs. 2-8.

[30545] GAM2191 gene, herein designated GAM GENE, and GAM2191 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30546] GAM2191 gene, herein designated GAM GENE, encodes a GAM2191 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2191 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2191 precursor RNA is designated SEQ ID:2168, and is provided hereinbelow with reference to the sequence listing part.

[30547] GAM2191 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30548] An enzyme complex designated DICER COMPLEX, dices the GAM2191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2191 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2191 RNA is designated SEQ ID:4782, and is provided hereinbelow with reference to the sequence listing part.

[30549] GAM2191 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2191 target RNA, herein designated GAM TARGET RNA. GAM2191 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30550] GAM2191 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2191 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2191 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2191 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2191 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30551] The complementary binding of GAM2191 RNA, herein designated GAM RNA, to target binding sites on GAM2191 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2191 target RNA, herein designated GAM TARGET RNA, into GAM2191 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30552] It is appreciated that GAM2191 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2191 target genes. The mRNA of each one of this plurality of GAM2191 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2191 RNA, herein designated GAM RNA, and which when bound by GAM2191 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2191 target proteins.

[30553] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2191 gene, herein designated GAM GENE, on one or more GAM2191 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30554] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2191 correlate with, and may be deduced from, the identity of the target

genes which GAM2191 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30555] Nucleotide sequences of the GAM2191 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2191 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2191 are further described hereinbelow with reference to Table 1.

[30556] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2191 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30557] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2192 (GAM2192) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30558] GAM2192 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2192 was detected is described hereinabove with reference to Figs. 2-8.

[30559] GAM2192 gene, herein designated GAM GENE, and GAM2192 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[30560] GAM2192 gene, herein designated GAM GENE, encodes a GAM2192 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2192 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2192 precursor RNA is designated SEQ ID:2169, and is provided hereinbelow with reference to the sequence listing part.

[30561] GAM2192 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30562] An enzyme complex designated DICER COMPLEX, dices the GAM2192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2192 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM2192 RNA is designated SEQ ID:4783, and is provided

hereinbelow with reference to the sequence listing part.

[30563] GAM2192 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2192 target RNA, herein designated GAM TARGET RNA. GAM2192 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30564] GAM2192 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2192 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2192 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2192 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2192 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30565] The complementary binding of GAM2192 RNA, herein designated GAM RNA, to target binding sites on GAM2192 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2192 target RNA, herein designated GAM TARGET RNA, into GAM2192 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30566] It is appreciated that GAM2192 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2192 target genes. The mRNA of each one of this plurality of GAM2192 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2192 RNA, herein designated GAM RNA, and which when bound by GAM2192 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2192 target proteins.

[30567] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2192 gene, herein designated GAM GENE, on one or more GAM2192 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30568] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2192 correlate with, and may be deduced from, the identity of the target genes which GAM2192 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30569] Nucleotide sequences of the GAM2192 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2192 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2192 are further described hereinbelow with reference to Table 1.

[30570] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2192 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30571] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2193 (GAM2193) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30572] GAM2193 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2193 was detected is described hereinabove with reference to Figs. 2-8.

[30573] GAM2193 gene, herein designated GAM GENE, and GAM2193 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30574] GAM2193 gene, herein designated GAM GENE, encodes a GAM2193 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2193 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2193 precursor RNA is designated SEQ ID:2170, and is provided hereinbelow with reference to the sequence listing part.

[30575] GAM2193 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30576] An enzyme complex designated DICER COMPLEX, dices the GAM2193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2193 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2193 RNA is designated SEQ ID:4785, and is provided hereinbelow with reference to the sequence listing part.

[30577] GAM2193 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2193 target RNA, herein designated GAM TARGET RNA. GAM2193 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30578] GAM2193 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2193 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2193 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2193 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2193 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30579] The complementary binding of GAM2193 RNA, herein designated GAM RNA, to target binding sites on GAM2193 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2193 target RNA, herein designated GAM TARGET RNA, into GAM2193 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30580] It is appreciated that GAM2193 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2193 target genes. The mRNA of each one of this plurality of GAM2193 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2193 RNA, herein designated GAM RNA, and which when bound by GAM2193 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2193 target proteins.

[30581] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2193 gene, herein designated GAM GENE, on one or more GAM2193 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30582] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2193 correlate with, and may be deduced from, the identity of the target genes which GAM2193 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30583] Nucleotide sequences of the GAM2193 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2193 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2193 are further described hereinbelow with reference to Table 1.

[30584] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2193 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30585] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2194 (GAM2194) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30586] GAM2194 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2194 was detected is described hereinabove with reference to Figs. 2-8.

[30587] GAM2194 gene, herein designated GAM GENE, and GAM2194 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30588] GAM2194 gene, herein designated GAM GENE, encodes a GAM2194 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2194 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2194 precursor RNA is designated SEQ ID:2171, and is provided hereinbelow with reference to the sequence listing part.

[30589] GAM2194 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2194 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30590] An enzyme complex designated DICER COMPLEX, dices the GAM2194 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2194 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2194 RNA is designated SEQ ID:4784, and is provided hereinbelow with reference to the sequence listing part.

[30591] GAM2194 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2194 target RNA, herein designated GAM TARGET RNA. GAM2194 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30592] GAM2194 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2194 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2194 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2194 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2194 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30593] The complementary binding of GAM2194 RNA, herein designated GAM RNA, to target binding sites on GAM2194 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2194 target RNA, herein designated GAM TARGET RNA, into GAM2194 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30594] It is appreciated that GAM2194 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2194 target genes. The mRNA of each one of this plurality of GAM2194 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2194 RNA, herein designated GAM RNA, and which when bound by GAM2194 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2194 target proteins.

[30595] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2194 gene, herein designated GAM GENE, on one or more GAM2194 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30596] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2194 correlate with, and may be deduced from, the identity of the target genes which GAM2194 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30597] Nucleotide sequences of the GAM2194 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2194 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2194 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2194 are further described hereinbelow with reference to Table 1.

[30598] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2194 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30599] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2195 (GAM2195) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30600] GAM2195 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2195 was detected is described hereinabove with reference to Figs. 2-8.

[30601] GAM2195 gene, herein designated GAM GENE, and GAM2195 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30602] GAM2195 gene, herein designated GAM GENE, encodes a GAM2195 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2195 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2195 precursor RNA is designated SEQ ID:2172, and is provided hereinbelow with reference to the sequence listing part.

[30603] GAM2195 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30604] An enzyme complex designated DICER COMPLEX, dices the GAM2195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2195 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2195 RNA is designated SEQ ID:4787, and is provided hereinbelow with reference to the sequence listing part.

[30605] GAM2195 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2195 target RNA, herein designated GAM TARGET RNA. GAM2195 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30606] GAM2195 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2195 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2195 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2195 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2195 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[30607] The complementary binding of GAM2195 RNA, herein designated GAM RNA, to target binding sites on GAM2195 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2195 target RNA, herein designated GAM TARGET RNA, into GAM2195 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30608] It is appreciated that GAM2195 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2195 target genes. The mRNA of each one of this plurality of GAM2195 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2195 RNA, herein designated GAM RNA, and which when bound by GAM2195 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2195 target proteins.

[30609] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2195 gene, herein designated GAM GENE, on one or more GAM2195 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30610] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2195 correlate with, and may be deduced from, the identity of the target genes which GAM2195 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30611] Nucleotide sequences of the GAM2195 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2195 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2195 are further described hereinbelow with reference to Table 1.

[30612] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2195 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30613] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2196 (GAM2196) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [30614] GAM2196 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2196 was detected is described hereinabove with reference to Figs. 2-8.
- [30615] GAM2196 gene, herein designated GAM GENE, and GAM2196 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [30616] GAM2196 gene, herein designated GAM GENE, encodes a GAM2196 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2196 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2196 precursor RNA is designated SEQ ID:2173, and is provided hereinbelow with reference to the sequence listing part.
- [30617] GAM2196 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [30618] An enzyme complex designated DICER COMPLEX, dices the GAM2196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2196 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2196 RNA is designated SEQ ID:4786, and is provided hereinbelow with reference to the sequence listing part.

[30619] GAM2196 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2196 target RNA, herein designated GAM TARGET RNA. GAM2196 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30620] GAM2196 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2196 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2196 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2196 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2196 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30621] The complementary binding of GAM2196 RNA, herein designated GAM RNA, to target binding sites on GAM2196 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2196 target RNA, herein designated GAM TARGET RNA, into GAM2196 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30622] It is appreciated that GAM2196 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2196 target genes. The mRNA of each one of this plurality of GAM2196 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2196 RNA, herein designated GAM RNA, and which when bound by GAM2196 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2196 target proteins.

[30623] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2196 gene, herein designated GAM GENE, on one or more GAM2196 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30624] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2196 correlate with, and may be deduced from, the identity of the target genes which GAM2196 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30625] Nucleotide sequences of the GAM2196 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2196 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2196 are further described hereinbelow with reference to Table 1.

[30626] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2196 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30627] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 2197 (GAM2197) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30628] GAM2197 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2197 was detected is described hereinabove with reference to Figs. 2-8.

[30629] GAM2197 gene, herein designated GAM GENE, and GAM2197 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30630] GAM2197 gene, herein designated GAM GENE, encodes a GAM2197 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2197 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2197 precursor RNA is designated SEQ ID:2174, and is provided hereinbelow with reference to the sequence listing part.

[30631] GAM2197 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [30632] An enzyme complex designated DICER COMPLEX, dices the GAM2197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2197 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2197 RNA is designated SEQ ID:4788, and is provided hereinbelow with reference to the sequence listing part.
- [30633] GAM2197 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2197 target RNA, herein designated GAM TARGET RNA. GAM2197 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [30634] GAM2197 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2197 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2197 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2197 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2197 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30635] The complementary binding of GAM2197 RNA, herein designated GAM RNA, to target binding sites on GAM2197 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2197 target RNA, herein designated GAM TARGET RNA, into GAM2197 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30636] It is appreciated that GAM2197 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2197 target genes. The mRNA of each one of this plurality of GAM2197 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2197 RNA, herein designated GAM RNA, and which when bound by GAM2197 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2197 target proteins.

[30637] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2197 gene, herein designated GAM GENE, on one or more GAM2197 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30638] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2197 correlate with, and may be deduced from, the identity of the target genes which GAM2197 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30639] Nucleotide sequences of the GAM2197 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2197 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2197 are further described hereinbelow with reference to Table 1.

[30640] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2197 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[30641] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2198 (GAM2198) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30642] GAM2198 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2198 was detected is described hereinabove with reference to Figs. 2-8.

[30643] GAM2198 gene, herein designated GAM GENE, and GAM2198 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30644] GAM2198 gene, herein designated GAM GENE, encodes a GAM2198 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2198 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2198 precursor RNA is designated SEQ ID:2175, and is provided hereinbelow with reference to the sequence listing part.

[30645] GAM2198 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2198 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30646] An enzyme complex designated DICER COMPLEX, dices the GAM2198 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2198 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2198 RNA is designated SEQ ID:4789, and is provided hereinbelow with reference to the sequence listing part.

[30647] GAM2198 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2198 target RNA, herein designated GAM TARGET RNA. GAM2198 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30648] GAM2198 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2198 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2198 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2198 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2198 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30649] The complementary binding of GAM2198 RNA, herein designated GAM RNA, to target binding sites on GAM2198 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2198 target RNA, herein designated GAM TARGET RNA, into GAM2198 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30650] It is appreciated that GAM2198 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2198 target genes. The mRNA of each one of this plurality of GAM2198 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2198 RNA, herein designated GAM RNA, and which when bound by GAM2198 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2198 target proteins.

[30651] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2198 gene, herein designated GAM GENE, on one or more GAM2198 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30652] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2198 correlate with, and may be deduced from, the identity of the target genes which GAM2198 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30653] Nucleotide sequences of the GAM2198 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2198 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2198 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2198 are further described hereinbelow with reference to Table 1.

[30654] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2198 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30655] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2199 (GAM2199) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30656] GAM2199 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2199 was detected is described hereinabove with reference to Figs. 2-8.

[30657] GAM2199 gene, herein designated GAM GENE, and GAM2199 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30658] GAM2199 gene, herein designated GAM GENE, encodes a GAM2199 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2199 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2199 precursor RNA is designated SEQ ID:2176, and is provided hereinbelow with reference to the sequence listing part.

[30659] GAM2199 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30660] An enzyme complex designated DICER COMPLEX, dices the GAM2199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2199 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2199 RNA is designated SEQ ID:4790, and is provided hereinbelow with reference to the sequence listing part.

[30661] GAM2199 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2199 target RNA, herein designated GAM TARGET RNA. GAM2199 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30662] GAM2199 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2199 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2199 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2199 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2199 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30663] The complementary binding of GAM2199 RNA, herein designated GAM RNA, to target binding sites on GAM2199 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2199 target RNA, herein designated GAM TARGET RNA, into GAM2199 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30664] It is appreciated that GAM2199 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2199 target genes. The

mRNA of each one of this plurality of GAM2199 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2199 RNA, herein designated GAM RNA, and which when bound by GAM2199 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2199 target proteins.

[30665] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2199 gene, herein designated GAM GENE, on one or more GAM2199 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30666] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2199 correlate with, and may be deduced from, the identity of the target genes which GAM2199 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30667] Nucleotide sequences of the GAM2199 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2199 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2199 are further described hereinbelow with reference to Table 1.

[30668] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2199 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30669] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2200 (GAM2200) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30670] GAM2200 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2200 was detected is described hereinabove with reference to Figs. 2-8.

[30671] GAM2200 gene, herein designated GAM GENE, and GAM2200 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30672] GAM2200 gene, herein designated GAM GENE, encodes a GAM2200 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2200 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2200 precursor RNA is designated SEQ ID:2177, and is provided hereinbelow with reference to the sequence listing part.

[30673] GAM2200 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2200 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30674] An enzyme complex designated DICER COMPLEX, dices the GAM2200 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2200 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2200 RNA is designated SEQ ID:4791, and is provided hereinbelow with reference to the sequence listing part.

[30675] GAM2200 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2200 target RNA, herein designated GAM TARGET RNA. GAM2200 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30676] GAM2200 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2200 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2200 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2200 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2200 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30677] The complementary binding of GAM2200 RNA, herein designated GAM RNA, to target binding sites on GAM2200 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2200 target RNA, herein designated GAM TARGET RNA, into GAM2200 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30678] It is appreciated that GAM2200 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2200 target genes. The mRNA of each one of this plurality of GAM2200 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2200 RNA, herein designated GAM RNA, and which when bound by GAM2200 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2200 target proteins.

[30679] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2200 gene, herein designated GAM GENE, on one or more GAM2200 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30680] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2200 correlate with, and may be deduced from, the identity of the target

genes which GAM2200 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30681] Nucleotide sequences of the GAM2200 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2200 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2200 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2200 are further described hereinbelow with reference to Table 1.

[30682] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2200 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30683] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2201 (GAM2201) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30684] GAM2201 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2201 was detected is described hereinabove with reference to Figs. 2-8.

[30685] GAM2201 gene, herein designated GAM GENE, and GAM2201 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[30686] GAM2201 gene, herein designated GAM GENE, encodes a GAM2201 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2201 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2201 precursor RNA is designated SEQ ID:2178, and is provided hereinbelow with reference to the sequence listing part.

[30687] GAM2201 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30688] An enzyme complex designated DICER COMPLEX, dices the GAM2201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2201 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2201 RNA is designated SEQ ID:4792, and is provided

hereinbelow with reference to the sequence listing part.

[30689] GAM2201 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2201 target RNA, herein designated GAM TARGET RNA. GAM2201 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30690] GAM2201 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2201 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2201 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2201 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2201 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30691] The complementary binding of GAM2201 RNA, herein designated GAM RNA, to target binding sites on GAM2201 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2201 target RNA, herein designated GAM TARGET RNA, into GAM2201 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30692] It is appreciated that GAM2201 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2201 target genes. The mRNA of each one of this plurality of GAM2201 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2201 RNA, herein designated GAM RNA, and which when bound by GAM2201 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2201 target proteins.

[30693] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2201 gene, herein designated GAM GENE, on one or more GAM2201 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30694] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2201 correlate with, and may be deduced from, the identity of the target genes which GAM2201 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30695] Nucleotide sequences of the GAM2201 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2201 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2201 are further described hereinbelow with reference to Table 1.

[30696] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2201 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30697] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2202 (GAM2202) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30698] GAM2202 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2202 was detected is described hereinabove with reference to Figs. 2-8.

[30699] GAM2202 gene, herein designated GAM GENE, and GAM2202 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30700] GAM2202 gene, herein designated GAM GENE, encodes a GAM2202 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2202 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2202 precursor RNA is designated SEQ ID:2179, and is provided hereinbelow with reference to the sequence listing part.

[30701] GAM2202 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30702] An enzyme complex designated DICER COMPLEX, dices the GAM2202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2202 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2202 RNA is designated SEQ ID:4793, and is provided hereinbelow with reference to the sequence listing part.

[30703] GAM2202 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2202 target RNA, herein designated GAM TARGET RNA. GAM2202 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30704] GAM2202 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2202 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2202 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2202 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2202 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30705] The complementary binding of GAM2202 RNA, herein designated GAM RNA, to target binding sites on GAM2202 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2202 target RNA, herein designated GAM TARGET RNA, into GAM2202 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30706] It is appreciated that GAM2202 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2202 target genes. The mRNA of each one of this plurality of GAM2202 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2202 RNA, herein designated GAM RNA, and which when bound by GAM2202 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2202 target proteins.

[30707] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2202 gene, herein designated GAM GENE, on one or more GAM2202 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30708] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2202 correlate with, and may be deduced from, the identity of the target genes which GAM2202 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30709] Nucleotide sequences of the GAM2202 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2202 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2202 are further described hereinbelow with reference to Table 1.

[30710] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2202 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30711] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2203 (GAM2203) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30712] GAM2203 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2203 was detected is described hereinabove with reference to Figs. 2-8.

[30713] GAM2203 gene, herein designated GAM GENE, and GAM2203 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30714] GAM2203 gene, herein designated GAM GENE, encodes a GAM2203 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2203 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2203 precursor RNA is designated SEQ ID:2180, and is provided hereinbelow with reference to the sequence listing part.

[30715] GAM2203 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2203 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [30716] An enzyme complex designated DICER COMPLEX, dices the GAM2203 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2203 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2203 RNA is designated SEQ ID:4794, and is provided hereinbelow with reference to the sequence listing part.
- [30717] GAM2203 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2203 target RNA, herein designated GAM TARGET RNA. GAM2203 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [30718] GAM2203 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2203 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2203 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2203 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2203 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30719] The complementary binding of GAM2203 RNA, herein designated GAM RNA, to target binding sites on GAM2203 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2203 target RNA, herein designated GAM TARGET RNA, into GAM2203 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30720] It is appreciated that GAM2203 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2203 target genes. The mRNA of each one of this plurality of GAM2203 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2203 RNA, herein designated GAM RNA, and which when bound by GAM2203 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2203 target proteins.

[30721] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2203 gene, herein designated GAM GENE, on one or more GAM2203 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30722] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2203 correlate with, and may be deduced from, the identity of the target genes which GAM2203 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30723] Nucleotide sequences of the GAM2203 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2203 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2203 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2203 are further described hereinbelow with reference to Table 1.

[30724] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2203 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [30725] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2204 (GAM2204) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [30726] GAM2204 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2204 was detected is described hereinabove with reference to Figs. 2-8.
- [30727] GAM2204 gene, herein designated GAM GENE, and GAM2204 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [30728] GAM2204 gene, herein designated GAM GENE, encodes a GAM2204 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2204 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2204 precursor RNA is designated SEQ ID:2181, and is provided hereinbelow with reference to the sequence listing part.
- [30729] GAM2204 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2204 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30730] An enzyme complex designated DICER COMPLEX, dices the GAM2204 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2204 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2204 RNA is designated SEQ ID:4795, and is provided hereinbelow with reference to the sequence listing part.

[30731] GAM2204 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2204 target RNA, herein designated GAM TARGET RNA. GAM2204 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30732] GAM2204 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2204 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2204 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2204 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2204 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30733] The complementary binding of GAM2204 RNA, herein designated GAM RNA, to target binding sites on GAM2204 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2204 target RNA, herein designated GAM TARGET RNA, into GAM2204 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30734] It is appreciated that GAM2204 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2204 target genes. The mRNA of each one of this plurality of GAM2204 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2204 RNA, herein designated GAM RNA, and which when bound by GAM2204 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2204 target proteins.

[30735] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2204 gene, herein designated GAM GENE, on one or more GAM2204 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30736] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2204 correlate with, and may be deduced from, the identity of the target genes which GAM2204 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30737] Nucleotide sequences of the GAM2204 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2204 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2204 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2204 are further described hereinbelow with reference to Table 1.

[30738] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2204 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30739] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2205 (GAM2205) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30740] GAM2205 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2205 was detected is described hereinabove with reference to Figs. 2-8.

[30741] GAM2205 gene, herein designated GAM GENE, and GAM2205 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30742] GAM2205 gene, herein designated GAM GENE, encodes a GAM2205 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2205 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2205 precursor RNA is designated SEQ ID:2182, and is provided hereinbelow with reference to the sequence listing part.

[30743] GAM2205 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30744] An enzyme complex designated DICER COMPLEX, dices the GAM2205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2205 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2205 RNA is designated SEQ ID:4796, and is provided hereinbelow with reference to the sequence listing part.

[30745] GAM2205 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2205 target RNA, herein designated GAM TARGET RNA. GAM2205 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30746] GAM2205 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2205 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2205 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2205 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2205 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30747] The complementary binding of GAM2205 RNA, herein designated GAM RNA, to target binding sites on GAM2205 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2205 target RNA, herein designated GAM TARGET RNA, into GAM2205 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30748] It is appreciated that GAM2205 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2205 target genes. The

mRNA of each one of this plurality of GAM2205 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2205 RNA, herein designated GAM RNA, and which when bound by GAM2205 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2205 target proteins.

[30749] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2205 gene, herein designated GAM GENE, on one or more GAM2205 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30750] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2205 correlate with, and may be deduced from, the identity of the target genes which GAM2205 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30751] Nucleotide sequences of the GAM2205 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2205 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2205 are further described hereinbelow with reference to Table 1.

[30752] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2205 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30753] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2206 (GAM2206) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30754] GAM2206 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2206 was detected is described hereinabove with reference to Figs. 2-8.

[30755] GAM2206 gene, herein designated GAM GENE, and GAM2206 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30756] GAM2206 gene, herein designated GAM GENE, encodes a GAM2206 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2206 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2206 precursor RNA is designated SEQ ID:2183, and is provided hereinbelow with reference to the sequence listing part.

[30757] GAM2206 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30758] An enzyme complex designated DICER COMPLEX, dices the GAM2206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2206 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2206 RNA is designated SEQ ID:4797, and is provided hereinbelow with reference to the sequence listing part.

[30759] GAM2206 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2206 target RNA, herein designated GAM TARGET RNA. GAM2206 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30760] GAM2206 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2206 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2206 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2206 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2206 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30761] The complementary binding of GAM2206 RNA, herein designated GAM RNA, to target binding sites on GAM2206 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2206 target RNA, herein designated GAM TARGET RNA, into GAM2206 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30762] It is appreciated that GAM2206 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2206 target genes. The mRNA of each one of this plurality of GAM2206 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2206 RNA, herein designated GAM RNA, and which when bound by GAM2206 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2206 target proteins.

[30763] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2206 gene, herein designated GAM GENE, on one or more GAM2206 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30764] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2206 correlate with, and may be deduced from, the identity of the target

genes which GAM2206 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30765] Nucleotide sequences of the GAM2206 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2206 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2206 are further described hereinbelow with reference to Table 1.

[30766] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2206 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30767] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2207 (GAM2207) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30768] GAM2207 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2207 was detected is described hereinabove with reference to Figs. 2-8.

[30769] GAM2207 gene, herein designated GAM GENE, and GAM2207 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[30770] GAM2207 gene, herein designated GAM GENE, encodes a GAM2207 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2207 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2207 precursor RNA is designated SEQ ID:2184, and is provided hereinbelow with reference to the sequence listing part.

[30771] GAM2207 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30772] An enzyme complex designated DICER COMPLEX, dices the GAM2207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2207 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2207 RNA is designated SEQ ID:4798, and is provided

hereinbelow with reference to the sequence listing part.

[30773] GAM2207 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2207 target RNA, herein designated GAM TARGET RNA. GAM2207 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30774] GAM2207 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2207 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2207 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2207 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2207 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30775] The complementary binding of GAM2207 RNA, herein designated GAM RNA, to target binding sites on GAM2207 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2207 target RNA, herein designated GAM TARGET RNA, into GAM2207 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30776] It is appreciated that GAM2207 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2207 target genes. The mRNA of each one of this plurality of GAM2207 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2207 RNA, herein designated GAM RNA, and which when bound by GAM2207 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2207 target proteins.

[30777] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2207 gene, herein designated GAM GENE, on one or more GAM2207 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30778] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2207 correlate with, and may be deduced from, the identity of the target genes which GAM2207 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30779] Nucleotide sequences of the GAM2207 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2207 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2207 are further described hereinbelow with reference to Table 1.

[30780] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2207 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30781] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2208 (GAM2208) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30782] GAM2208 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2208 was detected is described hereinabove with reference to Figs. 2-8.

[30783] GAM2208 gene, herein designated GAM GENE, and GAM2208 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30784] GAM2208 gene, herein designated GAM GENE, encodes a GAM2208 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2208 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2208 precursor RNA is designated SEQ ID:2185, and is provided hereinbelow with reference to the sequence listing part.

[30785] GAM2208 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30786] An enzyme complex designated DICER COMPLEX, dices the GAM2208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2208 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM2208 RNA is designated SEQ ID:4799, and is provided hereinbelow with reference to the sequence listing part.

[30787] GAM2208 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2208 target RNA, herein designated GAM TARGET RNA. GAM2208 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30788] GAM2208 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2208 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2208 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2208 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2208 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30789] The complementary binding of GAM2208 RNA, herein designated GAM RNA, to target binding sites on GAM2208 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2208 target RNA, herein designated GAM TARGET RNA, into GAM2208 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30790] It is appreciated that GAM2208 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2208 target genes. The mRNA of each one of this plurality of GAM2208 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2208 RNA, herein designated GAM RNA, and which when bound by GAM2208 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2208 target proteins.

[30791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2208 gene, herein designated GAM GENE, on one or more GAM2208 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30792] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2208 correlate with, and may be deduced from, the identity of the target genes which GAM2208 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30793] Nucleotide sequences of the GAM2208 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2208 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2208 are further described hereinbelow with reference to Table 1.

[30794] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2208 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30795] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2209 (GAM2209) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30796] GAM2209 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2209 was detected is described hereinabove with reference to Figs. 2-8.

[30797] GAM2209 gene, herein designated GAM GENE, and GAM2209 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30798] GAM2209 gene, herein designated GAM GENE, encodes a GAM2209 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2209 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2209 precursor RNA is designated SEQ ID:2186, and is provided hereinbelow with reference to the sequence listing part.

[30799] GAM2209 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30800] An enzyme complex designated DICER COMPLEX, dices the GAM2209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2209 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2209 RNA is designated SEQ ID:4800, and is provided hereinbelow with reference to the sequence listing part.

[30801] GAM2209 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2209 target RNA, herein designated GAM TARGET RNA. GAM2209 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30802] GAM2209 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2209 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2209 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2209 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2209 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30803] The complementary binding of GAM2209 RNA, herein designated GAM RNA, to target binding sites on GAM2209 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2209 target RNA, herein designated GAM TARGET RNA, into GAM2209 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30804] It is appreciated that GAM2209 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2209 target genes. The mRNA of each one of this plurality of GAM2209 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2209 RNA, herein designated GAM RNA, and which when bound by GAM2209 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2209 target proteins.

[30805] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2209 gene, herein designated GAM GENE, on one or more GAM2209 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30806] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2209 correlate with, and may be deduced from, the identity of the target genes which GAM2209 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30807] Nucleotide sequences of the GAM2209 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2209 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2209 are further described hereinbelow with reference to Table 1.

[30808] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2209 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[30809] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2210 (GAM2210) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30810] GAM2210 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2210 was detected is described hereinabove with reference to Figs. 2-8.

[30811] GAM2210 gene, herein designated GAM GENE, and GAM2210 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30812] GAM2210 gene, herein designated GAM GENE, encodes a GAM2210 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2210 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2210 precursor RNA is designated SEQ ID:2187, and is provided hereinbelow with reference to the sequence listing part.

[30813] GAM2210 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2210 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30814] An enzyme complex designated DICER COMPLEX, dices the GAM2210 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2210 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2210 RNA is designated SEQ ID:4801, and is provided hereinbelow with reference to the sequence listing part.

[30815] GAM2210 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2210 target RNA, herein designated GAM TARGET RNA. GAM2210 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30816] GAM2210 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2210 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2210 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2210 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2210 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30817] The complementary binding of GAM2210 RNA, herein designated GAM RNA, to target binding sites on GAM2210 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2210 target RNA, herein designated GAM TARGET RNA, into GAM2210 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30818] It is appreciated that GAM2210 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2210 target genes. The mRNA of each one of this plurality of GAM2210 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2210 RNA, herein designated GAM RNA, and which when bound by GAM2210 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2210 target proteins.

[30819] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2210 gene, herein designated GAM GENE, on one or more GAM2210 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30820] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2210 correlate with, and may be deduced from, the identity of the target genes which GAM2210 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30821] Nucleotide sequences of the GAM2210 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2210 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2210 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2210 are further described hereinbelow with reference to Table 1.

[30822] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2210 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30823] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2211 (GAM2211) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30824] GAM2211 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2211 was detected is described hereinabove with reference to Figs. 2-8.

[30825] GAM2211 gene, herein designated GAM GENE, and GAM2211 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30826] GAM2211 gene, herein designated GAM GENE, encodes a GAM2211 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2211 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2211 precursor RNA is designated SEQ ID:2188, and is provided hereinbelow with reference to the sequence listing part.

[30827] GAM2211 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30828] An enzyme complex designated DICER COMPLEX, dices the GAM2211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2211 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2211 RNA is designated SEQ ID:4802, and is provided hereinbelow with reference to the sequence listing part.

[30829] GAM2211 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2211 target RNA, herein designated GAM TARGET RNA. GAM2211 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30830] GAM2211 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2211 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2211 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2211 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2211 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30831] The complementary binding of GAM2211 RNA, herein designated GAM RNA, to target binding sites on GAM2211 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2211 target RNA, herein designated GAM TARGET RNA, into GAM2211 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30832] It is appreciated that GAM2211 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2211 target genes. The

mRNA of each one of this plurality of GAM2211 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2211 RNA, herein designated GAM RNA, and which when bound by GAM2211 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2211 target proteins.

[30833] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2211 gene, herein designated GAM GENE, on one or more GAM2211 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30834] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2211 correlate with, and may be deduced from, the identity of the target genes which GAM2211 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30835] Nucleotide sequences of the GAM2211 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2211 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2211 are further described hereinbelow with reference to Table 1.

[30836] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2211 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30837] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2212 (GAM2212) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30838] GAM2212 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2212 was detected is described hereinabove with reference to Figs. 2-8.

[30839] GAM2212 gene, herein designated GAM GENE, and GAM2212 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30840] GAM2212 gene, herein designated GAM GENE, encodes a GAM2212 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2212 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2212 precursor RNA is designated SEQ ID:2189, and is provided hereinbelow with reference to the sequence listing part.

[30841] GAM2212 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30842] An enzyme complex designated DICER COMPLEX, dices the GAM2212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2212 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2212 RNA is designated SEQ ID:4803, and is provided hereinbelow with reference to the sequence listing part.

[30843] GAM2212 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2212 target RNA, herein designated GAM TARGET RNA. GAM2212 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30844] GAM2212 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2212 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2212 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2212 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2212 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30845] The complementary binding of GAM2212 RNA, herein designated GAM RNA, to target binding sites on GAM2212 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2212 target RNA, herein designated GAM TARGET RNA, into GAM2212 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30846] It is appreciated that GAM2212 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2212 target genes. The mRNA of each one of this plurality of GAM2212 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2212 RNA, herein designated GAM RNA, and which when bound by GAM2212 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2212 target proteins.

[30847] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2212 gene, herein designated GAM GENE, on one or more GAM2212 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30848] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2212 correlate with, and may be deduced from, the identity of the target

genes which GAM2212 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30849] Nucleotide sequences of the GAM2212 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2212 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2212 are further described hereinbelow with reference to Table 1.

[30850] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2212 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30851] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2213 (GAM2213) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30852] GAM2213 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2213 was detected is described hereinabove with reference to Figs. 2-8.

[30853] GAM2213 gene, herein designated GAM GENE, and GAM2213 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[30854] GAM2213 gene, herein designated GAM GENE, encodes a GAM2213 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2213 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2213 precursor RNA is designated SEQ ID:2190, and is provided hereinbelow with reference to the sequence listing part.

[30855] GAM2213 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30856] An enzyme complex designated DICER COMPLEX, dices the GAM2213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2213 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2213 RNA is designated SEQ ID:4805, and is provided

hereinbelow with reference to the sequence listing part.

[30857] GAM2213 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2213 target RNA, herein designated GAM TARGET RNA. GAM2213 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30858] GAM2213 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2213 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2213 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2213 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2213 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30859] The complementary binding of GAM2213 RNA, herein designated GAM RNA, to target binding sites on GAM2213 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2213 target RNA, herein designated GAM TARGET RNA, into GAM2213 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30860] It is appreciated that GAM2213 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2213 target genes. The mRNA of each one of this plurality of GAM2213 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2213 RNA, herein designated GAM RNA, and which when bound by GAM2213 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2213 target proteins.

[30861] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2213 gene, herein designated GAM GENE, on one or more GAM2213 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30862] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2213 correlate with, and may be deduced from, the identity of the target genes which GAM2213 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30863] Nucleotide sequences of the GAM2213 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2213 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2213 are further described hereinbelow with reference to Table 1.

[30864] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2213 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30865] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2214 (GAM2214) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30866] GAM2214 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2214 was detected is described hereinabove with reference to Figs. 2-8.

[30867] GAM2214 gene, herein designated GAM GENE, and GAM2214 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30868] GAM2214 gene, herein designated GAM GENE, encodes a GAM2214 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2214 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2214 precursor RNA is designated SEQ ID:2191, and is provided hereinbelow with reference to the sequence listing part.

[30869] GAM2214 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2214 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30870] An enzyme complex designated DICER COMPLEX, dices the GAM2214 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2214 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM2214 RNA is designated SEQ ID:4804, and is provided hereinbelow with reference to the sequence listing part.

[30871] GAM2214 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2214 target RNA, herein designated GAM TARGET RNA. GAM2214 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30872] GAM2214 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2214 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2214 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2214 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2214 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30873] The complementary binding of GAM2214 RNA, herein designated GAM RNA, to target binding sites on GAM2214 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2214 target RNA, herein designated GAM TARGET RNA, into GAM2214 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30874] It is appreciated that GAM2214 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2214 target genes. The mRNA of each one of this plurality of GAM2214 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2214 RNA, herein designated GAM RNA, and which when bound by GAM2214 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2214 target proteins.

[30875] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2214 gene, herein designated GAM GENE, on one or more GAM2214 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30876] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2214 correlate with, and may be deduced from, the identity of the target genes which GAM2214 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30877] Nucleotide sequences of the GAM2214 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2214 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2214 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2214 are further described hereinbelow with reference to Table 1.

[30878] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2214 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30879] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2215 (GAM2215) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30880] GAM2215 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2215 was detected is described hereinabove with reference to Figs. 2-8.

[30881] GAM2215 gene, herein designated GAM GENE, and GAM2215 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30882] GAM2215 gene, herein designated GAM GENE, encodes a GAM2215 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2215 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2215 precursor RNA is designated SEQ ID:2192, and is provided hereinbelow with reference to the sequence listing part.

[30883] GAM2215 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2215 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [30884] An enzyme complex designated DICER COMPLEX, dices the GAM2215 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2215 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2215 RNA is designated SEQ ID:4806, and is provided hereinbelow with reference to the sequence listing part.
- [30885] GAM2215 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2215 target RNA, herein designated GAM TARGET RNA. GAM2215 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [30886] GAM2215 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2215 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2215 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2215 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2215 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30887] The complementary binding of GAM2215 RNA, herein designated GAM RNA, to target binding sites on GAM2215 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2215 target RNA, herein designated GAM TARGET RNA, into GAM2215 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30888] It is appreciated that GAM2215 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2215 target genes. The mRNA of each one of this plurality of GAM2215 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2215 RNA, herein designated GAM RNA, and which when bound by GAM2215 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2215 target proteins.

[30889] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2215 gene, herein designated GAM GENE, on one or more GAM2215 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30890] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2215 correlate with, and may be deduced from, the identity of the target genes which GAM2215 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30891] Nucleotide sequences of the GAM2215 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2215 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2215 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2215 are further described hereinbelow with reference to Table 1.

[30892] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2215 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[30893] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2216 (GAM2216) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30894] GAM2216 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2216 was detected is described hereinabove with reference to Figs. 2-8.

[30895] GAM2216 gene, herein designated GAM GENE, and GAM2216 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30896] GAM2216 gene, herein designated GAM GENE, encodes a GAM2216 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2216 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2216 precursor RNA is designated SEQ ID:2193, and is provided hereinbelow with reference to the sequence listing part.

[30897] GAM2216 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30898] An enzyme complex designated DICER COMPLEX, dices the GAM2216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2216 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2216 RNA is designated SEQ ID:4807, and is provided hereinbelow with reference to the sequence listing part.

[30899] GAM2216 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2216 target RNA, herein designated GAM TARGET RNA. GAM2216 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30900] GAM2216 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2216 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2216 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2216 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2216 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30901] The complementary binding of GAM2216 RNA, herein designated GAM RNA, to target binding sites on GAM2216 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2216 target RNA, herein designated GAM TARGET RNA, into GAM2216 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30902] It is appreciated that GAM2216 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2216 target genes. The mRNA of each one of this plurality of GAM2216 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2216 RNA, herein designated GAM RNA, and which when bound by GAM2216 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2216 target proteins.

[30903] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2216 gene, herein designated GAM GENE, on one or more GAM2216 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30904] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2216 correlate with, and may be deduced from, the identity of the target genes which GAM2216 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30905] Nucleotide sequences of the GAM2216 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2216 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2216 are further described hereinbelow with reference to Table 1.

[30906] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2216 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30907] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2217 (GAM2217) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30908] GAM2217 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2217 was detected is described hereinabove with reference to Figs. 2-8.

[30909] GAM2217 gene, herein designated GAM GENE, and GAM2217 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30910] GAM2217 gene, herein designated GAM GENE, encodes a GAM2217 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2217 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2217 precursor RNA is designated SEQ ID:2194, and is provided hereinbelow with reference to the sequence listing part.

[30911] GAM2217 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30912] An enzyme complex designated DICER COMPLEX, dices the GAM2217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2217 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM2217 RNA is designated SEQ ID:4808, and is provided hereinbelow with reference to the sequence listing part.

[30913] GAM2217 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2217 target RNA, herein designated GAM TARGET RNA. GAM2217 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30914] GAM2217 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2217 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2217 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2217 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2217 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30915] The complementary binding of GAM2217 RNA, herein designated GAM RNA, to target binding sites on GAM2217 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2217 target RNA, herein designated GAM TARGET RNA, into GAM2217 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30916] It is appreciated that GAM2217 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2217 target genes. The

mRNA of each one of this plurality of GAM2217 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2217 RNA, herein designated GAM RNA, and which when bound by GAM2217 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2217 target proteins.

[30917] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2217 gene, herein designated GAM GENE, on one or more GAM2217 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30918] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2217 correlate with, and may be deduced from, the identity of the target genes which GAM2217 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30919] Nucleotide sequences of the GAM2217 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2217 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2217 are further described hereinbelow with reference to Table 1.

[30920] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2217 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30921] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2218 (GAM2218) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30922] GAM2218 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2218 was detected is described hereinabove with reference to Figs. 2-8.

[30923] GAM2218 gene, herein designated GAM GENE, and GAM2218 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30924] GAM2218 gene, herein designated GAM GENE, encodes a GAM2218 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2218 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2218 precursor RNA is designated SEQ ID:2195, and is provided hereinbelow with reference to the sequence listing part.

[30925] GAM2218 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2218 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30926] An enzyme complex designated DICER COMPLEX, dices the GAM2218 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2218 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2218 RNA is designated SEQ ID:4809, and is provided hereinbelow with reference to the sequence listing part.

[30927] GAM2218 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2218 target RNA, herein designated GAM TARGET RNA. GAM2218 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30928] GAM2218 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2218 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2218 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2218 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2218 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30929] The complementary binding of GAM2218 RNA, herein designated GAM RNA, to target binding sites on GAM2218 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2218 target RNA, herein designated GAM TARGET RNA, into GAM2218 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30930] It is appreciated that GAM2218 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2218 target genes. The mRNA of each one of this plurality of GAM2218 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2218 RNA, herein designated GAM RNA, and which when bound by GAM2218 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2218 target proteins.

[30931] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2218 gene, herein designated GAM GENE, on one or more GAM2218 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30932] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2218 correlate with, and may be deduced from, the identity of the target

genes which GAM2218 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30933] Nucleotide sequences of the GAM2218 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2218 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2218 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2218 are further described hereinbelow with reference to Table 1.

[30934] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2218 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30935] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2219 (GAM2219) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30936] GAM2219 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2219 was detected is described hereinabove with reference to Figs. 2-8.

[30937] GAM2219 gene, herein designated GAM GENE, and GAM2219 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[30938] GAM2219 gene, herein designated GAM GENE, encodes a GAM2219 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2219 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2219 precursor RNA is designated SEQ ID:2196, and is provided hereinbelow with reference to the sequence listing part.

[30939] GAM2219 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2219 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30940] An enzyme complex designated DICER COMPLEX, dices the GAM2219 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2219 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2219 RNA is designated SEQ ID:4810, and is provided

hereinbelow with reference to the sequence listing part.

[30941] GAM2219 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2219 target RNA, herein designated GAM TARGET RNA. GAM2219 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30942] GAM2219 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2219 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2219 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2219 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2219 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30943] The complementary binding of GAM2219 RNA, herein designated GAM RNA, to target binding sites on GAM2219 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2219 target RNA, herein designated GAM TARGET RNA, into GAM2219 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30944] It is appreciated that GAM2219 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2219 target genes. The mRNA of each one of this plurality of GAM2219 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2219 RNA, herein designated GAM RNA, and which when bound by GAM2219 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2219 target proteins.

[30945] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2219 gene, herein designated GAM GENE, on one or more GAM2219 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30946] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2219 correlate with, and may be deduced from, the identity of the target genes which GAM2219 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30947] Nucleotide sequences of the GAM2219 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2219 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2219 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2219 are further described hereinbelow with reference to Table 1.

[30948] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2219 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30949] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2220 (GAM2220) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30950] GAM2220 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2220 was detected is described hereinabove with reference to Figs. 2-8.

[30951] GAM2220 gene, herein designated GAM GENE, and GAM2220 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30952] GAM2220 gene, herein designated GAM GENE, encodes a GAM2220 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2220 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2220 precursor RNA is designated SEQ ID:2197, and is provided hereinbelow with reference to the sequence listing part.

[30953] GAM2220 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2220 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30954] An enzyme complex designated DICER COMPLEX, dices the GAM2220 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2220 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2220 RNA is designated SEQ ID:4811, and is provided hereinbelow with reference to the sequence listing part.

[30955] GAM2220 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2220 target RNA, herein designated GAM TARGET RNA. GAM2220 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30956] GAM2220 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2220 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2220 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2220 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2220 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30957] The complementary binding of GAM2220 RNA, herein designated GAM RNA, to target binding sites on GAM2220 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2220 target RNA, herein designated GAM TARGET RNA, into GAM2220 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30958] It is appreciated that GAM2220 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2220 target genes. The mRNA of each one of this plurality of GAM2220 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2220 RNA, herein designated GAM RNA, and which when bound by GAM2220 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2220 target proteins.

[30959] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2220 gene, herein designated GAM GENE, on one or more GAM2220 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30960] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2220 correlate with, and may be deduced from, the identity of the target genes which GAM2220 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30961] Nucleotide sequences of the GAM2220 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2220 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2220 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2220 are further described hereinbelow with reference to Table 1.

[30962] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2220 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30963] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2221 (GAM2221) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30964] GAM2221 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2221 was detected is described hereinabove with reference to Figs. 2-8.

[30965] GAM2221 gene, herein designated GAM GENE, and GAM2221 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30966] GAM2221 gene, herein designated GAM GENE, encodes a GAM2221 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2221 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2221 precursor RNA is designated SEQ ID:2198, and is provided hereinbelow with reference to the sequence listing part.

[30967] GAM2221 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [30968] An enzyme complex designated DICER COMPLEX, dices the GAM2221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2221 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2221 RNA is designated SEQ ID:4812, and is provided hereinbelow with reference to the sequence listing part.
- [30969] GAM2221 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2221 target RNA, herein designated GAM TARGET RNA. GAM2221 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [30970] GAM2221 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2221 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2221 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2221 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2221 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30971] The complementary binding of GAM2221 RNA, herein designated GAM RNA, to target binding sites on GAM2221 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2221 target RNA, herein designated GAM TARGET RNA, into GAM2221 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30972] It is appreciated that GAM2221 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2221 target genes. The mRNA of each one of this plurality of GAM2221 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2221 RNA, herein designated GAM RNA, and which when bound by GAM2221 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2221 target proteins.

[30973] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2221 gene, herein designated GAM GENE, on one or more GAM2221 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30974] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2221 correlate with, and may be deduced from, the identity of the target genes which GAM2221 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30975] Nucleotide sequences of the GAM2221 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2221 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2221 are further described hereinbelow with reference to Table 1.

[30976] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2221 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[30977] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2222 (GAM2222) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30978] GAM2222 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2222 was detected is described hereinabove with reference to Figs. 2-8.

[30979] GAM2222 gene, herein designated GAM GENE, and GAM2222 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30980] GAM2222 gene, herein designated GAM GENE, encodes a GAM2222 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2222 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2222 precursor RNA is designated SEQ ID:2199, and is provided hereinbelow with reference to the sequence listing part.

[30981] GAM2222 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30982] An enzyme complex designated DICER COMPLEX, dices the GAM2222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2222 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2222 RNA is designated SEQ ID:4813, and is provided hereinbelow with reference to the sequence listing part.

[30983] GAM2222 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2222 target RNA, herein designated GAM TARGET RNA. GAM2222 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30984] GAM2222 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2222 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2222 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2222 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2222 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30985] The complementary binding of GAM2222 RNA, herein designated GAM RNA, to target binding sites on GAM2222 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2222 target RNA, herein designated GAM TARGET RNA, into GAM2222 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30986] It is appreciated that GAM2222 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2222 target genes. The mRNA of each one of this plurality of GAM2222 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2222 RNA, herein designated GAM RNA, and which when bound by GAM2222 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2222 target proteins.

[30987] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2222 gene, herein designated GAM GENE, on one or more GAM2222 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30988] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2222 correlate with, and may be deduced from, the identity of the target genes which GAM2222 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30989] Nucleotide sequences of the GAM2222 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2222 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2222 are further described hereinbelow with reference to Table 1.

[30990] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2222 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30991] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2223 (GAM2223) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30992] GAM2223 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2223 was detected is described hereinabove with reference to Figs. 2-8.

[30993] GAM2223 gene, herein designated GAM GENE, and GAM2223 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30994] GAM2223 gene, herein designated GAM GENE, encodes a GAM2223 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2223 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2223 precursor RNA is designated SEQ ID:2200, and is provided hereinbelow with reference to the sequence listing part.

[30995] GAM2223 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30996] An enzyme complex designated DICER COMPLEX, dices the GAM2223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2223 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2223 RNA is designated SEQ ID:4814, and is provided hereinbelow with reference to the sequence listing part.

[30997] GAM2223 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2223 target RNA, herein designated GAM TARGET RNA. GAM2223 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30998] GAM2223 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2223 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2223 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2223 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2223 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30999] The complementary binding of GAM2223 RNA, herein designated GAM RNA, to target binding sites on GAM2223 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2223 target RNA, herein designated GAM TARGET RNA, into GAM2223 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31000] It is appreciated that GAM2223 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2223 target genes. The

mRNA of each one of this plurality of GAM2223 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2223 RNA, herein designated GAM RNA, and which when bound by GAM2223 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2223 target proteins.

[31001] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2223 gene, herein designated GAM GENE, on one or more GAM2223 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31002] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2223 correlate with, and may be deduced from, the identity of the target genes which GAM2223 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31003] Nucleotide sequences of the GAM2223 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2223 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2223 are further described hereinbelow with reference to Table 1.

[31004] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2223 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31005] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2224 (GAM2224) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31006] GAM2224 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2224 was detected is described hereinabove with reference to Figs. 2-8.

[31007] GAM2224 gene, herein designated GAM GENE, and GAM2224 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31008] GAM2224 gene, herein designated GAM GENE, encodes a GAM2224 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2224 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2224 precursor RNA is designated SEQ ID:2201, and is provided hereinbelow with reference to the sequence listing part.

[31009] GAM2224 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2224 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31010] An enzyme complex designated DICER COMPLEX, dices the GAM2224 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2224 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2224 RNA is designated SEQ ID:4815, and is provided hereinbelow with reference to the sequence listing part.

[31011] GAM2224 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2224 target RNA, herein designated GAM TARGET RNA. GAM2224 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31012] GAM2224 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2224 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2224 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2224 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2224 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31013] The complementary binding of GAM2224 RNA, herein designated GAM RNA, to target binding sites on GAM2224 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2224 target RNA, herein designated GAM TARGET RNA, into GAM2224 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31014] It is appreciated that GAM2224 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2224 target genes. The mRNA of each one of this plurality of GAM2224 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2224 RNA, herein designated GAM RNA, and which when bound by GAM2224 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2224 target proteins.

[31015] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2224 gene, herein designated GAM GENE, on one or more GAM2224 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31016] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2224 correlate with, and may be deduced from, the identity of the target

genes which GAM2224 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31017] Nucleotide sequences of the GAM2224 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2224 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2224 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2224 are further described hereinbelow with reference to Table 1.

[31018] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2224 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31019] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2225 (GAM2225) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31020] GAM2225 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2225 was detected is described hereinabove with reference to Figs. 2-8.

[31021] GAM2225 gene, herein designated GAM GENE, and GAM2225 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[31022] GAM2225 gene, herein designated GAM GENE, encodes a GAM2225 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2225 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2225 precursor RNA is designated SEQ ID:2202, and is provided hereinbelow with reference to the sequence listing part.

[31023] GAM2225 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2225 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31024] An enzyme complex designated DICER COMPLEX, dices the GAM2225 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2225 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2225 RNA is designated SEQ ID:4816, and is provided

hereinbelow with reference to the sequence listing part.

[31025] GAM2225 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2225 target RNA, herein designated GAM TARGET RNA. GAM2225 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31026] GAM2225 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2225 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2225 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2225 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2225 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31027] The complementary binding of GAM2225 RNA, herein designated GAM RNA, to target binding sites on GAM2225 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2225 target RNA, herein designated GAM TARGET RNA, into GAM2225 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31028] It is appreciated that GAM2225 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2225 target genes. The mRNA of each one of this plurality of GAM2225 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2225 RNA, herein designated GAM RNA, and which when bound by GAM2225 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2225 target proteins.

[31029] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2225 gene, herein designated GAM GENE, on one or more GAM2225 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31030] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2225 correlate with, and may be deduced from, the identity of the target genes which GAM2225 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31031] Nucleotide sequences of the GAM2225 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2225 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2225 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2225 are further described hereinbelow with reference to Table 1.

[31032] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2225 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31033] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2226 (GAM2226) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31034] GAM2226 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2226 was detected is described hereinabove with reference to Figs. 2-8.

[31035] GAM2226 gene, herein designated GAM GENE, and GAM2226 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31036] GAM2226 gene, herein designated GAM GENE, encodes a GAM2226 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2226 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2226 precursor RNA is designated SEQ ID:2203, and is provided hereinbelow with reference to the sequence listing part.

[31037] GAM2226 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2226 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31038] An enzyme complex designated DICER COMPLEX, dices the GAM2226 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2226 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2226 RNA is designated SEQ ID:4817, and is provided hereinbelow with reference to the sequence listing part.

[31039] GAM2226 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2226 target RNA, herein designated GAM TARGET RNA. GAM2226 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31040] GAM2226 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2226 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2226 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2226 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2226 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31041] The complementary binding of GAM2226 RNA, herein designated GAM RNA, to target binding sites on GAM2226 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2226 target RNA, herein designated GAM TARGET RNA, into GAM2226 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31042] It is appreciated that GAM2226 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2226 target genes. The mRNA of each one of this plurality of GAM2226 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2226 RNA, herein designated GAM RNA, and which when bound by GAM2226 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2226 target proteins.

[31043] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2226 gene, herein designated GAM GENE, on one or more GAM2226 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31044] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2226 correlate with, and may be deduced from, the identity of the target genes which GAM2226 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31045] Nucleotide sequences of the GAM2226 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2226 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2226 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2226 are further described hereinbelow with reference to Table 1.

[31046] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2226 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31047] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2227 (GAM2227) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31048] GAM2227 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2227 was detected is described hereinabove with reference to Figs. 2-8.

[31049] GAM2227 gene, herein designated GAM GENE, and GAM2227 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31050] GAM2227 gene, herein designated GAM GENE, encodes a GAM2227 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2227 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2227 precursor RNA is designated SEQ ID:2204, and is provided hereinbelow with reference to the sequence listing part.

[31051] GAM2227 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [31052] An enzyme complex designated DICER COMPLEX, dices the GAM2227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2227 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2227 RNA is designated SEQ ID:4818, and is provided hereinbelow with reference to the sequence listing part.
- [31053] GAM2227 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2227 target RNA, herein designated GAM TARGET RNA. GAM2227 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [31054] GAM2227 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2227 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2227 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2227 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2227 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31055] The complementary binding of GAM2227 RNA, herein designated GAM RNA, to target binding sites on GAM2227 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2227 target RNA, herein designated GAM TARGET RNA, into GAM2227 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31056] It is appreciated that GAM2227 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2227 target genes. The mRNA of each one of this plurality of GAM2227 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2227 RNA, herein designated GAM RNA, and which when bound by GAM2227 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2227 target proteins.

[31057] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2227 gene, herein designated GAM GENE, on one or more GAM2227 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31058] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2227 correlate with, and may be deduced from, the identity of the target genes which GAM2227 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31059] Nucleotide sequences of the GAM2227 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2227 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2227 are further described hereinbelow with reference to Table 1.

[31060] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2227 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[31061] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2228 (GAM2228) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31062] GAM2228 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2228 was detected is described hereinabove with reference to Figs. 2-8.

[31063] GAM2228 gene, herein designated GAM GENE, and GAM2228 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31064] GAM2228 gene, herein designated GAM GENE, encodes a GAM2228 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2228 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2228 precursor RNA is designated SEQ ID:2205, and is provided hereinbelow with reference to the sequence listing part.

[31065] GAM2228 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31066] An enzyme complex designated DICER COMPLEX, dices the GAM2228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2228 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM2228 RNA is designated SEQ ID:4820, and is provided hereinbelow with reference to the sequence listing part.

[31067] GAM2228 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2228 target RNA, herein designated GAM TARGET RNA. GAM2228 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31068] GAM2228 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2228 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2228 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2228 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2228 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31069] The complementary binding of GAM2228 RNA, herein designated GAM RNA, to target binding sites on GAM2228 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2228 target RNA, herein designated GAM TARGET RNA, into GAM2228 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31070] It is appreciated that GAM2228 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2228 target genes. The mRNA of each one of this plurality of GAM2228 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2228 RNA, herein designated GAM RNA, and which when bound by GAM2228 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2228 target proteins.

[31071] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2228 gene, herein designated GAM GENE, on one or more GAM2228 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31072] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2228 correlate with, and may be deduced from, the identity of the target genes which GAM2228 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31073] Nucleotide sequences of the GAM2228 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2228 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2228 are further described hereinbelow with reference to Table 1.

[31074] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2228 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31075] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2229 (GAM2229) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31076] GAM2229 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2229 was detected is described hereinabove with reference to Figs. 2-8.

[31077] GAM2229 gene, herein designated GAM GENE, and GAM2229 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31078] GAM2229 gene, herein designated GAM GENE, encodes a GAM2229 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2229 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2229 precursor RNA is designated SEQ ID:2206, and is provided hereinbelow with reference to the sequence listing part.

[31079] GAM2229 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2229 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31080] An enzyme complex designated DICER COMPLEX, dices the GAM2229 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2229 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2229 RNA is designated SEQ ID:4819, and is provided hereinbelow with reference to the sequence listing part.

[31081] GAM2229 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2229 target RNA, herein designated GAM TARGET RNA. GAM2229 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31082] GAM2229 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2229 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2229 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2229 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2229 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31083] The complementary binding of GAM2229 RNA, herein designated GAM RNA, to target binding sites on GAM2229 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2229 target RNA, herein designated GAM TARGET RNA, into GAM2229 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31084] It is appreciated that GAM2229 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2229 target genes. The

mRNA of each one of this plurality of GAM2229 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2229 RNA, herein designated GAM RNA, and which when bound by GAM2229 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2229 target proteins.

[31085] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2229 gene, herein designated GAM GENE, on one or more GAM2229 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31086] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2229 correlate with, and may be deduced from, the identity of the target genes which GAM2229 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31087] Nucleotide sequences of the GAM2229 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2229 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2229 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2229 are further described hereinbelow with reference to Table 1.

[31088] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2229 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31089] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2230 (GAM2230) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31090] GAM2230 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2230 was detected is described hereinabove with reference to Figs. 2-8.

[31091] GAM2230 gene, herein designated GAM GENE, and GAM2230 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31092] GAM2230 gene, herein designated GAM GENE, encodes a GAM2230 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2230 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2230 precursor RNA is designated SEQ ID:2207, and is provided hereinbelow with reference to the sequence listing part.

[31093] GAM2230 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2230 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31094] An enzyme complex designated DICER COMPLEX, dices the GAM2230 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2230 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM2230 RNA is designated SEQ ID:4821, and is provided hereinbelow with reference to the sequence listing part.

[31095] GAM2230 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2230 target RNA, herein designated GAM TARGET RNA. GAM2230 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31096] GAM2230 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2230 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2230 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2230 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2230 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31097] The complementary binding of GAM2230 RNA, herein designated GAM RNA, to target binding sites on GAM2230 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2230 target RNA, herein designated GAM TARGET RNA, into GAM2230 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31098] It is appreciated that GAM2230 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2230 target genes. The mRNA of each one of this plurality of GAM2230 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2230 RNA, herein designated GAM RNA, and which when bound by GAM2230 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2230 target proteins.

[31099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2230 gene, herein designated GAM GENE, on one or more GAM2230 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31100] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2230 correlate with, and may be deduced from, the identity of the target

genes which GAM2230 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31101] Nucleotide sequences of the GAM2230 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2230 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2230 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2230 are further described hereinbelow with reference to Table 1.

[31102] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2230 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31103] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2231 (GAM2231) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31104] GAM2231 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2231 was detected is described hereinabove with reference to Figs. 2-8.

[31105] GAM2231 gene, herein designated GAM GENE, and GAM2231 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

- [31106] GAM2231 gene, herein designated GAM GENE, encodes a GAM2231 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2231 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2231 precursor RNA is designated SEQ ID:2208, and is provided hereinbelow with reference to the sequence listing part.
- [31107] GAM2231 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2231 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [31108] An enzyme complex designated DICER COMPLEX, dices the GAM2231 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2231 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2231 RNA is designated SEQ ID:4822, and is provided

hereinbelow with reference to the sequence listing part.

[31109] GAM2231 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2231 target RNA, herein designated GAM TARGET RNA. GAM2231 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31110] GAM2231 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2231 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2231 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2231 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2231 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31111] The complementary binding of GAM2231 RNA, herein designated GAM RNA, to target binding sites on GAM2231 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2231 target RNA, herein designated GAM TARGET RNA, into GAM2231 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31112] It is appreciated that GAM2231 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2231 target genes. The mRNA of each one of this plurality of GAM2231 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2231 RNA, herein designated GAM RNA, and which when bound by GAM2231 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2231 target proteins.

[31113] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2231 gene, herein designated GAM GENE, on one or more GAM2231 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31114] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2231 correlate with, and may be deduced from, the identity of the target genes which GAM2231 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31115] Nucleotide sequences of the GAM2231 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2231 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2231 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2231 are further described hereinbelow with reference to Table 1.

[31116] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2231 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31117] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2232 (GAM2232) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31118] GAM2232 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2232 was detected is described hereinabove with reference to Figs. 2-8.

[31119] GAM2232 gene, herein designated GAM GENE, and GAM2232 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31120] GAM2232 gene, herein designated GAM GENE, encodes a GAM2232 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2232 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2232 precursor RNA is designated SEQ ID:2209, and is provided hereinbelow with reference to the sequence listing part.

[31121] GAM2232 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31122] An enzyme complex designated DICER COMPLEX, dices the GAM2232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2232 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2232 RNA is designated SEQ ID:4823, and is provided hereinbelow with reference to the sequence listing part.

[31123] GAM2232 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2232 target RNA, herein designated GAM TARGET RNA. GAM2232 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31124] GAM2232 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2232 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2232 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2232 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2232 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31125] The complementary binding of GAM2232 RNA, herein designated GAM RNA, to target binding sites on GAM2232 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2232 target RNA, herein designated GAM TARGET RNA, into GAM2232 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31126] It is appreciated that GAM2232 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2232 target genes. The mRNA of each one of this plurality of GAM2232 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2232 RNA, herein designated GAM RNA, and which when bound by GAM2232 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2232 target proteins.

[31127] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2232 gene, herein designated GAM GENE, on one or more GAM2232 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31128] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2232 correlate with, and may be deduced from, the identity of the target genes which GAM2232 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31129] Nucleotide sequences of the GAM2232 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2232 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2232 are further described hereinbelow with reference to Table 1.

[31130] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2232 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31131] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2233 (GAM2233) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31132] GAM2233 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2233 was detected is described hereinabove with reference to Figs. 2-8.

[31133] GAM2233 gene, herein designated GAM GENE, and GAM2233 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31134] GAM2233 gene, herein designated GAM GENE, encodes a GAM2233 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2233 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2233 precursor RNA is designated SEQ ID:2210, and is provided hereinbelow with reference to the sequence listing part.

[31135] GAM2233 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [31136] An enzyme complex designated DICER COMPLEX, dices the GAM2233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2233 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of GAM2233 RNA is designated SEQ ID:4824, and is provided hereinbelow with reference to the sequence listing part.
- [31137] GAM2233 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2233 target RNA, herein designated GAM TARGET RNA. GAM2233 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [31138] GAM2233 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2233 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2233 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2233 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2233 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31139] The complementary binding of GAM2233 RNA, herein designated GAM RNA, to target binding sites on GAM2233 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2233 target RNA, herein designated GAM TARGET RNA, into GAM2233 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31140] It is appreciated that GAM2233 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2233 target genes. The mRNA of each one of this plurality of GAM2233 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2233 RNA, herein designated GAM RNA, and which when bound by GAM2233 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2233 target proteins.

[31141] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2233 gene, herein designated GAM GENE, on one or more GAM2233 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31142] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2233 correlate with, and may be deduced from, the identity of the target genes which GAM2233 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31143] Nucleotide sequences of the GAM2233 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2233 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2233 are further described hereinbelow with reference to Table 1.

[31144] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2233 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [31145] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2234 (GAM2234) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [31146] GAM2234 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2234 was detected is described hereinabove with reference to Figs. 2-8.
- [31147] GAM2234 gene, herein designated GAM GENE, and GAM2234 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [31148] GAM2234 gene, herein designated GAM GENE, encodes a GAM2234 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2234 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2234 precursor RNA is designated SEQ ID:2211, and is provided hereinbelow with reference to the sequence listing part.
- [31149] GAM2234 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31150] An enzyme complex designated DICER COMPLEX, dices the GAM2234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2234 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM2234 RNA is designated SEQ ID:4825, and is provided hereinbelow with reference to the sequence listing part.

[31151] GAM2234 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2234 target RNA, herein designated GAM TARGET RNA. GAM2234 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31152] GAM2234 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2234 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2234 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2234 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2234 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31153] The complementary binding of GAM2234 RNA, herein designated GAM RNA, to target binding sites on GAM2234 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2234 target RNA, herein designated GAM TARGET RNA, into GAM2234 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31154] It is appreciated that GAM2234 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2234 target genes. The mRNA of each one of this plurality of GAM2234 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2234 RNA, herein designated GAM RNA, and which when bound by GAM2234 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2234 target proteins.

[31155] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2234 gene, herein designated GAM GENE, on one or more GAM2234 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31156] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2234 correlate with, and may be deduced from, the identity of the target genes which GAM2234 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31157] Nucleotide sequences of the GAM2234 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2234 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2234 are further described hereinbelow with reference to Table 1.

[31158] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2234 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31159] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2235 (GAM2235) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31160] GAM2235 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2235 was detected is described hereinabove with reference to Figs. 2-8.

[31161] GAM2235 gene, herein designated GAM GENE, and GAM2235 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31162] GAM2235 gene, herein designated GAM GENE, encodes a GAM2235 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2235 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2235 precursor RNA is designated SEQ ID:2212, and is provided hereinbelow with reference to the sequence listing part.

[31163] GAM2235 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2235 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31164] An enzyme complex designated DICER COMPLEX, dices the GAM2235 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2235 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2235 RNA is designated SEQ ID:4826, and is provided hereinbelow with reference to the sequence listing part.

[31165] GAM2235 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2235 target RNA, herein designated GAM TARGET RNA. GAM2235 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31166] GAM2235 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2235 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2235 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2235 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2235 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31167] The complementary binding of GAM2235 RNA, herein designated GAM RNA, to target binding sites on GAM2235 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2235 target RNA, herein designated GAM TARGET RNA, into GAM2235 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31168] It is appreciated that GAM2235 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2235 target genes. The

mRNA of each one of this plurality of GAM2235 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2235 RNA, herein designated GAM RNA, and which when bound by GAM2235 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2235 target proteins.

[31169] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2235 gene, herein designated GAM GENE, on one or more GAM2235 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31170] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2235 correlate with, and may be deduced from, the identity of the target genes which GAM2235 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31171] Nucleotide sequences of the GAM2235 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2235 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2235 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2235 are further described hereinbelow with reference to Table 1.

[31172] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2235 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31173] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2236 (GAM2236) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31174] GAM2236 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2236 was detected is described hereinabove with reference to Figs. 2-8.

[31175] GAM2236 gene, herein designated GAM GENE, and GAM2236 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31176] GAM2236 gene, herein designated GAM GENE, encodes a GAM2236 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2236 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2236 precursor RNA is designated SEQ ID:2213, and is provided hereinbelow with reference to the sequence listing part.

[31177] GAM2236 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2236 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31178] An enzyme complex designated DICER COMPLEX, dices the GAM2236 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2236 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2236 RNA is designated SEQ ID:4827, and is provided hereinbelow with reference to the sequence listing part.

[31179] GAM2236 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2236 target RNA, herein designated GAM TARGET RNA. GAM2236 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31180] GAM2236 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2236 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2236 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2236 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2236 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31181] The complementary binding of GAM2236 RNA, herein designated GAM RNA, to target binding sites on GAM2236 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2236 target RNA, herein designated GAM TARGET RNA, into GAM2236 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31182] It is appreciated that GAM2236 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2236 target genes. The mRNA of each one of this plurality of GAM2236 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2236 RNA, herein designated GAM RNA, and which when bound by GAM2236 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2236 target proteins.

[31183] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2236 gene, herein designated GAM GENE, on one or more GAM2236 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31184] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2236 correlate with, and may be deduced from, the identity of the target

genes which GAM2236 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31185] Nucleotide sequences of the GAM2236 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2236 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2236 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2236 are further described hereinbelow with reference to Table 1.

[31186] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2236 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31187] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2237 (GAM2237) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31188] GAM2237 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2237 was detected is described hereinabove with reference to Figs. 2-8.

[31189] GAM2237 gene, herein designated GAM GENE, and GAM2237 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[31190] GAM2237 gene, herein designated GAM GENE, encodes a GAM2237 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2237 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2237 precursor RNA is designated SEQ ID:2214, and is provided hereinbelow with reference to the sequence listing part.

[31191] GAM2237 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31192] An enzyme complex designated DICER COMPLEX, dices the GAM2237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2237 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2237 RNA is designated SEQ ID:4828, and is provided

hereinbelow with reference to the sequence listing part.

[31193] GAM2237 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2237 target RNA, herein designated GAM TARGET RNA. GAM2237 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31194] GAM2237 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2237 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2237 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2237 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2237 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31195] The complementary binding of GAM2237 RNA, herein designated GAM RNA, to target binding sites on GAM2237 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2237 target RNA, herein designated GAM TARGET RNA, into GAM2237 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31196] It is appreciated that GAM2237 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2237 target genes. The mRNA of each one of this plurality of GAM2237 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2237 RNA, herein designated GAM RNA, and which when bound by GAM2237 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2237 target proteins.

[31197] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2237 gene, herein designated GAM GENE, on one or more GAM2237 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31198] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2237 correlate with, and may be deduced from, the identity of the target genes which GAM2237 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31199] Nucleotide sequences of the GAM2237 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2237 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2237 are further described hereinbelow with reference to Table 1.

[31200] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2237 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31201] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2238 (GAM2238) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31202] GAM2238 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2238 was detected is described hereinabove with reference to Figs. 2-8.

[31203] GAM2238 gene, herein designated GAM GENE, and GAM2238 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31204] GAM2238 gene, herein designated GAM GENE, encodes a GAM2238 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2238 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2238 precursor RNA is designated SEQ ID:2215, and is provided hereinbelow with reference to the sequence listing part.

[31205] GAM2238 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31206] An enzyme complex designated DICER COMPLEX, dices the GAM2238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2238 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2238 RNA is designated SEQ ID:4830, and is provided hereinbelow with reference to the sequence listing part.

[31207] GAM2238 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2238 target RNA, herein designated GAM TARGET RNA. GAM2238 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31208] GAM2238 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2238 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2238 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2238 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2238 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31209] The complementary binding of GAM2238 RNA, herein designated GAM RNA, to target binding sites on GAM2238 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2238 target RNA, herein designated GAM TARGET RNA, into GAM2238 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31210] It is appreciated that GAM2238 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2238 target genes. The mRNA of each one of this plurality of GAM2238 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2238 RNA, herein designated GAM RNA, and which when bound by GAM2238 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2238 target proteins.

[31211] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2238 gene, herein designated GAM GENE, on one or more GAM2238 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31212] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2238 correlate with, and may be deduced from, the identity of the target genes which GAM2238 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31213] Nucleotide sequences of the GAM2238 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2238 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2238 are further described hereinbelow with reference to Table 1.

[31214] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2238 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31215] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2239 (GAM2239) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31216] GAM2239 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2239 was detected is described hereinabove with reference to Figs. 2-8.

[31217] GAM2239 gene, herein designated GAM GENE, and GAM2239 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31218] GAM2239 gene, herein designated GAM GENE, encodes a GAM2239 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2239 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2239 precursor RNA is designated SEQ ID:2216, and is provided hereinbelow with reference to the sequence listing part.

[31219] GAM2239 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2239 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [31220] An enzyme complex designated DICER COMPLEX, dices the GAM2239 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2239 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2239 RNA is designated SEQ ID:4829, and is provided hereinbelow with reference to the sequence listing part.
- [31221] GAM2239 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2239 target RNA, herein designated GAM TARGET RNA. GAM2239 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [31222] GAM2239 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2239 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2239 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2239 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2239 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31223] The complementary binding of GAM2239 RNA, herein designated GAM RNA, to target binding sites on GAM2239 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2239 target RNA, herein designated GAM TARGET RNA, into GAM2239 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31224] It is appreciated that GAM2239 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2239 target genes. The mRNA of each one of this plurality of GAM2239 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2239 RNA, herein designated GAM RNA, and which when bound by GAM2239 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2239 target proteins.

[31225] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2239 gene, herein designated GAM GENE, on one or more GAM2239 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31226] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2239 correlate with, and may be deduced from, the identity of the target genes which GAM2239 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31227] Nucleotide sequences of the GAM2239 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2239 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2239 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2239 are further described hereinbelow with reference to Table 1.

[31228] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2239 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[31229] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2240 (GAM2240) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31230] GAM2240 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2240 was detected is described hereinabove with reference to Figs. 2-8.

[31231] GAM2240 gene, herein designated GAM GENE, and GAM2240 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31232] GAM2240 gene, herein designated GAM GENE, encodes a GAM2240 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2240 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2240 precursor RNA is designated SEQ ID:2217, and is provided hereinbelow with reference to the sequence listing part.

[31233] GAM2240 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31234] An enzyme complex designated DICER COMPLEX, dices the GAM2240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2240 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2240 RNA is designated SEQ ID:4831, and is provided hereinbelow with reference to the sequence listing part.

[31235] GAM2240 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2240 target RNA, herein designated GAM TARGET RNA. GAM2240 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31236] GAM2240 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2240 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2240 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2240 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2240 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31237] The complementary binding of GAM2240 RNA, herein designated GAM RNA, to target binding sites on GAM2240 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2240 target RNA, herein designated GAM TARGET RNA, into GAM2240 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31238] It is appreciated that GAM2240 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2240 target genes. The mRNA of each one of this plurality of GAM2240 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2240 RNA, herein designated GAM RNA, and which when bound by GAM2240 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2240 target proteins.

[31239] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2240 gene, herein designated GAM GENE, on one or more GAM2240 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31240] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2240 correlate with, and may be deduced from, the identity of the target genes which GAM2240 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31241] Nucleotide sequences of the GAM2240 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2240 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2240 are further described hereinbelow with reference to Table 1.

[31242] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2240 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31243] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2241 (GAM2241) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31244] GAM2241 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2241 was detected is described hereinabove with reference to Figs. 2-8.

[31245] GAM2241 gene, herein designated GAM GENE, and GAM2241 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31246] GAM2241 gene, herein designated GAM GENE, encodes a GAM2241 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2241 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2241 precursor RNA is designated SEQ ID:2218, and is provided hereinbelow with reference to the sequence listing part.

[31247] GAM2241 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2241 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31248] An enzyme complex designated DICER COMPLEX, dices the GAM2241 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2241 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2241 RNA is designated SEQ ID:4832, and is provided hereinbelow with reference to the sequence listing part.

[31249] GAM2241 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2241 target RNA, herein designated GAM TARGET RNA. GAM2241 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31250] GAM2241 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2241 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2241 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2241 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2241 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31251] The complementary binding of GAM2241 RNA, herein designated GAM RNA, to target binding sites on GAM2241 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2241 target RNA, herein designated GAM TARGET RNA, into GAM2241 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31252] It is appreciated that GAM2241 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2241 target genes. The

mRNA of each one of this plurality of GAM2241 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2241 RNA, herein designated GAM RNA, and which when bound by GAM2241 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2241 target proteins.

[31253] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2241 gene, herein designated GAM GENE, on one or more GAM2241 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31254] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2241 correlate with, and may be deduced from, the identity of the target genes which GAM2241 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31255] Nucleotide sequences of the GAM2241 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2241 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2241 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2241 are further described hereinbelow with reference to Table 1.

[31256] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2241 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31257] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2242 (GAM2242) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31258] GAM2242 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2242 was detected is described hereinabove with reference to Figs. 2-8.

[31259] GAM2242 gene, herein designated GAM GENE, and GAM2242 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31260] GAM2242 gene, herein designated GAM GENE, encodes a GAM2242 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2242 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2242 precursor RNA is designated SEQ ID:2219, and is provided hereinbelow with reference to the sequence listing part.

[31261] GAM2242 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31262] An enzyme complex designated DICER COMPLEX, dices the GAM2242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2242 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2242 RNA is designated SEQ ID:4833, and is provided hereinbelow with reference to the sequence listing part.

[31263] GAM2242 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2242 target RNA, herein designated GAM TARGET RNA. GAM2242 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31264] GAM2242 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2242 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2242 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2242 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2242 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31265] The complementary binding of GAM2242 RNA, herein designated GAM RNA, to target binding sites on GAM2242 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2242 target RNA, herein designated GAM TARGET RNA, into GAM2242 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31266] It is appreciated that GAM2242 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2242 target genes. The mRNA of each one of this plurality of GAM2242 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2242 RNA, herein designated GAM RNA, and which when bound by GAM2242 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2242 target proteins.

[31267] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2242 gene, herein designated GAM GENE, on one or more GAM2242 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31268] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2242 correlate with, and may be deduced from, the identity of the target

genes which GAM2242 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31269] Nucleotide sequences of the GAM2242 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2242 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2242 are further described hereinbelow with reference to Table 1.

[31270] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2242 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31271] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2243 (GAM2243) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31272] GAM2243 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2243 was detected is described hereinabove with reference to Figs. 2-8.

[31273] GAM2243 gene, herein designated GAM GENE, and GAM2243 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[31274] GAM2243 gene, herein designated GAM GENE, encodes a GAM2243 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2243 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2243 precursor RNA is designated SEQ ID:2220, and is provided hereinbelow with reference to the sequence listing part.

[31275] GAM2243 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31276] An enzyme complex designated DICER COMPLEX, dices the GAM2243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2243 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2243 RNA is designated SEQ ID:4834, and is provided

hereinbelow with reference to the sequence listing part.

[31277] GAM2243 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2243 target RNA, herein designated GAM TARGET RNA. GAM2243 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31278] GAM2243 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2243 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2243 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2243 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2243 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31279] The complementary binding of GAM2243 RNA, herein designated GAM RNA, to target binding sites on GAM2243 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2243 target RNA, herein designated GAM TARGET RNA, into GAM2243 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31280] It is appreciated that GAM2243 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2243 target genes. The mRNA of each one of this plurality of GAM2243 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2243 RNA, herein designated GAM RNA, and which when bound by GAM2243 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2243 target proteins.

[31281] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2243 gene, herein designated GAM GENE, on one or more GAM2243 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31282] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2243 correlate with, and may be deduced from, the identity of the target genes which GAM2243 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31283] Nucleotide sequences of the GAM2243 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2243 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2243 are further described hereinbelow with reference to Table 1.

[31284] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2243 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31285] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2244 (GAM2244) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31286] GAM2244 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2244 was detected is described hereinabove with reference to Figs. 2-8.

[31287] GAM2244 gene, herein designated GAM GENE, and GAM2244 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31288] GAM2244 gene, herein designated GAM GENE, encodes a GAM2244 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2244 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2244 precursor RNA is designated SEQ ID:2221, and is provided hereinbelow with reference to the sequence listing part.

[31289] GAM2244 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2244 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31290] An enzyme complex designated DICER COMPLEX, dices the GAM2244 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2244 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2244 RNA is designated SEQ ID:4835, and is provided hereinbelow with reference to the sequence listing part.

[31291] GAM2244 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2244 target RNA, herein designated GAM TARGET RNA. GAM2244 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31292] GAM2244 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2244 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2244 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2244 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2244 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31293] The complementary binding of GAM2244 RNA, herein designated GAM RNA, to target binding sites on GAM2244 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2244 target RNA, herein designated GAM TARGET RNA, into GAM2244 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31294] It is appreciated that GAM2244 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2244 target genes. The mRNA of each one of this plurality of GAM2244 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2244 RNA, herein designated GAM RNA, and which when bound by GAM2244 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2244 target proteins.

[31295] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2244 gene, herein designated GAM GENE, on one or more GAM2244 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31296] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2244 correlate with, and may be deduced from, the identity of the target genes which GAM2244 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31297] Nucleotide sequences of the GAM2244 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2244 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2244 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2244 are further described hereinbelow with reference to Table 1.

[31298] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2244 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31299] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2245 (GAM2245) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31300] GAM2245 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2245 was detected is described hereinabove with reference to Figs. 2-8.

[31301] GAM2245 gene, herein designated GAM GENE, and GAM2245 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31302] GAM2245 gene, herein designated GAM GENE, encodes a GAM2245 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2245 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2245 precursor RNA is designated SEQ ID:2222, and is provided hereinbelow with reference to the sequence listing part.

[31303] GAM2245 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [31304] An enzyme complex designated DICER COMPLEX, dices the GAM2245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2245 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2245 RNA is designated SEQ ID:4836, and is provided hereinbelow with reference to the sequence listing part.
- [31305] GAM2245 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2245 target RNA, herein designated GAM TARGET RNA. GAM2245 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [31306] GAM2245 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2245 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2245 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2245 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2245 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31307] The complementary binding of GAM2245 RNA, herein designated GAM RNA, to target binding sites on GAM2245 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2245 target RNA, herein designated GAM TARGET RNA, into GAM2245 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31308] It is appreciated that GAM2245 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2245 target genes. The mRNA of each one of this plurality of GAM2245 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2245 RNA, herein designated GAM RNA, and which when bound by GAM2245 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2245 target proteins.

[31309] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2245 gene, herein designated GAM GENE, on one or more GAM2245 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31310] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2245 correlate with, and may be deduced from, the identity of the target genes which GAM2245 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31311] Nucleotide sequences of the GAM2245 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2245 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2245 are further described hereinbelow with reference to Table 1.

[31312] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2245 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[31313] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2246 (GAM2246) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31314] GAM2246 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2246 was detected is described hereinabove with reference to Figs. 2-8.

[31315] GAM2246 gene, herein designated GAM GENE, and GAM2246 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31316] GAM2246 gene, herein designated GAM GENE, encodes a GAM2246 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2246 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2246 precursor RNA is designated SEQ ID:2223, and is provided hereinbelow with reference to the sequence listing part.

[31317] GAM2246 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31318] An enzyme complex designated DICER COMPLEX, dices the GAM2246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2246 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2246 RNA is designated SEQ ID:4837, and is provided hereinbelow with reference to the sequence listing part.

[31319] GAM2246 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2246 target RNA, herein designated GAM TARGET RNA. GAM2246 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31320] GAM2246 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2246 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2246 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2246 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2246 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31321] The complementary binding of GAM2246 RNA, herein designated GAM RNA, to target binding sites on GAM2246 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2246 target RNA, herein designated GAM TARGET RNA, into GAM2246 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31322] It is appreciated that GAM2246 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2246 target genes. The mRNA of each one of this plurality of GAM2246 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2246 RNA, herein designated GAM RNA, and which when bound by GAM2246 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2246 target proteins.

[31323] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2246 gene, herein designated GAM GENE, on one or more GAM2246 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31324] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2246 correlate with, and may be deduced from, the identity of the target genes which GAM2246 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31325] Nucleotide sequences of the GAM2246 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2246 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2246 are further described hereinbelow with reference to Table 1.

[31326] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2246 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31327] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2247 (GAM2247) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31328] GAM2247 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2247 was detected is described hereinabove with reference to Figs. 2-8.

[31329] GAM2247 gene, herein designated GAM GENE, and GAM2247 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31330] GAM2247 gene, herein designated GAM GENE, encodes a GAM2247 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2247 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2247 precursor RNA is designated SEQ ID:2224, and is provided hereinbelow with reference to the sequence listing part.

[31331] GAM2247 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31332] An enzyme complex designated DICER COMPLEX, dices the GAM2247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2247 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2247 RNA is designated SEQ ID:4838, and is provided hereinbelow with reference to the sequence listing part.

[31333] GAM2247 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2247 target RNA, herein designated GAM TARGET RNA. GAM2247 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31334] GAM2247 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2247 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2247 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2247 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2247 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31335] The complementary binding of GAM2247 RNA, herein designated GAM RNA, to target binding sites on GAM2247 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2247 target RNA, herein designated GAM TARGET RNA, into GAM2247 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31336] It is appreciated that GAM2247 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2247 target genes. The

mRNA of each one of this plurality of GAM2247 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2247 RNA, herein designated GAM RNA, and which when bound by GAM2247 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2247 target proteins.

[31337] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2247 gene, herein designated GAM GENE, on one or more GAM2247 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31338] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2247 correlate with, and may be deduced from, the identity of the target genes which GAM2247 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31339] Nucleotide sequences of the GAM2247 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2247 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2247 are further described hereinbelow with reference to Table 1.

[31340] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2247 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31341] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2248 (GAM2248) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31342] GAM2248 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2248 was detected is described hereinabove with reference to Figs. 2-8.

[31343] GAM2248 gene, herein designated GAM GENE, and GAM2248 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31344] GAM2248 gene, herein designated GAM GENE, encodes a GAM2248 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2248 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2248 precursor RNA is designated SEQ ID:2225, and is provided hereinbelow with reference to the sequence listing part.

[31345] GAM2248 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2248 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31346] An enzyme complex designated DICER COMPLEX, dices the GAM2248 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2248 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM2248 RNA is designated SEQ ID:4839, and is provided hereinbelow with reference to the sequence listing part.

[31347] GAM2248 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2248 target RNA, herein designated GAM TARGET RNA. GAM2248 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31348] GAM2248 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2248 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2248 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2248 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2248 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31349] The complementary binding of GAM2248 RNA, herein designated GAM RNA, to target binding sites on GAM2248 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2248 target RNA, herein designated GAM TARGET RNA, into GAM2248 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31350] It is appreciated that GAM2248 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2248 target genes. The mRNA of each one of this plurality of GAM2248 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2248 RNA, herein designated GAM RNA, and which when bound by GAM2248 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2248 target proteins.

[31351] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2248 gene, herein designated GAM GENE, on one or more GAM2248 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31352] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2248 correlate with, and may be deduced from, the identity of the target

genes which GAM2248 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31353] Nucleotide sequences of the GAM2248 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2248 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2248 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2248 are further described hereinbelow with reference to Table 1.

[31354] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2248 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31355] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2249 (GAM2249) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31356] GAM2249 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2249 was detected is described hereinabove with reference to Figs. 2-8.

[31357] GAM2249 gene, herein designated GAM GENE, and GAM2249 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[31358] GAM2249 gene, herein designated GAM GENE, encodes a GAM2249 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2249 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2249 precursor RNA is designated SEQ ID:2226, and is provided hereinbelow with reference to the sequence listing part.

[31359] GAM2249 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2249 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31360] An enzyme complex designated DICER COMPLEX, dices the GAM2249 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2249 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2249 RNA is designated SEQ ID:4840, and is provided

hereinbelow with reference to the sequence listing part.

[31361] GAM2249 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2249 target RNA, herein designated GAM TARGET RNA. GAM2249 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31362] GAM2249 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2249 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2249 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2249 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2249 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31363] The complementary binding of GAM2249 RNA, herein designated GAM RNA, to target binding sites on GAM2249 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2249 target RNA, herein designated GAM TARGET RNA, into GAM2249 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31364] It is appreciated that GAM2249 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2249 target genes. The mRNA of each one of this plurality of GAM2249 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2249 RNA, herein designated GAM RNA, and which when bound by GAM2249 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2249 target proteins.

[31365] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2249 gene, herein designated GAM GENE, on one or more GAM2249 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31366] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2249 correlate with, and may be deduced from, the identity of the target genes which GAM2249 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31367] Nucleotide sequences of the GAM2249 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2249 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2249 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2249 are further described hereinbelow with reference to Table 1.

[31368] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2249 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31369] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2250 (GAM2250) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31370] GAM2250 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2250 was detected is described hereinabove with reference to Figs. 2-8.

[31371] GAM2250 gene, herein designated GAM GENE, and GAM2250 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31372] GAM2250 gene, herein designated GAM GENE, encodes a GAM2250 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2250 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2250 precursor RNA is designated SEQ ID:2227, and is provided hereinbelow with reference to the sequence listing part.

[31373] GAM2250 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2250 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31374] An enzyme complex designated DICER COMPLEX, dices the GAM2250 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2250 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2250 RNA is designated SEQ ID:4841, and is provided hereinbelow with reference to the sequence listing part.

[31375] GAM2250 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2250 target RNA, herein designated GAM TARGET RNA. GAM2250 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31376] GAM2250 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2250 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2250 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2250 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2250 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31377] The complementary binding of GAM2250 RNA, herein designated GAM RNA, to target binding sites on GAM2250 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2250 target RNA, herein designated GAM TARGET RNA, into GAM2250 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31378] It is appreciated that GAM2250 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2250 target genes. The mRNA of each one of this plurality of GAM2250 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2250 RNA, herein designated GAM RNA, and which when bound by GAM2250 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2250 target proteins.

[31379] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2250 gene, herein designated GAM GENE, on one or more GAM2250 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31380] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2250 correlate with, and may be deduced from, the identity of the target genes which GAM2250 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31381] Nucleotide sequences of the GAM2250 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2250 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2250 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2250 are further described hereinbelow with reference to Table 1.

[31382] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2250 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31383] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2251 (GAM2251) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31384] GAM2251 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2251 was detected is described hereinabove with reference to Figs. 2-8.

[31385] GAM2251 gene, herein designated GAM GENE, and GAM2251 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31386] GAM2251 gene, herein designated GAM GENE, encodes a GAM2251 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2251 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2251 precursor RNA is designated SEQ ID:2228, and is provided hereinbelow with reference to the sequence listing part.

[31387] GAM2251 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [31388] An enzyme complex designated DICER COMPLEX, dices the GAM2251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2251 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2251 RNA is designated SEQ ID:4842, and is provided hereinbelow with reference to the sequence listing part.
- [31389] GAM2251 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2251 target RNA, herein designated GAM TARGET RNA. GAM2251 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [31390] GAM2251 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2251 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2251 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2251 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2251 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31391] The complementary binding of GAM2251 RNA, herein designated GAM RNA, to target binding sites on GAM2251 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2251 target RNA, herein designated GAM TARGET RNA, into GAM2251 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31392] It is appreciated that GAM2251 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2251 target genes. The mRNA of each one of this plurality of GAM2251 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2251 RNA, herein designated GAM RNA, and which when bound by GAM2251 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2251 target proteins.

[31393] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2251 gene, herein designated GAM GENE, on one or more GAM2251 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31394] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2251 correlate with, and may be deduced from, the identity of the target genes which GAM2251 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31395] Nucleotide sequences of the GAM2251 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2251 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2251 are further described hereinbelow with reference to Table 1.

[31396] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2251 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[31397] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2252 (GAM2252) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31398] GAM2252 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2252 was detected is described hereinabove with reference to Figs. 2-8.

[31399] GAM2252 gene, herein designated GAM GENE, and GAM2252 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31400] GAM2252 gene, herein designated GAM GENE, encodes a GAM2252 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2252 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2252 precursor RNA is designated SEQ ID:2229, and is provided hereinbelow with reference to the sequence listing part.

[31401] GAM2252 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2252 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31402] An enzyme complex designated DICER COMPLEX, dices the GAM2252 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2252 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2252 RNA is designated SEQ ID:4843, and is provided hereinbelow with reference to the sequence listing part.

[31403] GAM2252 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2252 target RNA, herein designated GAM TARGET RNA. GAM2252 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31404] GAM2252 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2252 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2252 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2252 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2252 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31405] The complementary binding of GAM2252 RNA, herein designated GAM RNA, to target binding sites on GAM2252 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2252 target RNA, herein designated GAM TARGET RNA, into GAM2252 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31406] It is appreciated that GAM2252 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2252 target genes. The mRNA of each one of this plurality of GAM2252 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2252 RNA, herein designated GAM RNA, and which when bound by GAM2252 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2252 target proteins.

[31407] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2252 gene, herein designated GAM GENE, on one or more GAM2252 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31408] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2252 correlate with, and may be deduced from, the identity of the target genes which GAM2252 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31409] Nucleotide sequences of the GAM2252 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2252 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2252 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2252 are further described hereinbelow with reference to Table 1.

- [31410] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2252 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [31411] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2253 (GAM2253) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [31412] GAM2253 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2253 was detected is described hereinabove with reference to Figs. 2-8.
- [31413] GAM2253 gene, herein designated GAM GENE, and GAM2253 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [31414] GAM2253 gene, herein designated GAM GENE, encodes a GAM2253 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2253 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2253 precursor RNA is designated SEQ ID:2230, and is provided hereinbelow with reference to the sequence listing part.

[31415] GAM2253 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2253 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31416] An enzyme complex designated DICER COMPLEX, dices the GAM2253 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2253 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2253 RNA is designated SEQ ID:4844, and is provided hereinbelow with reference to the sequence listing part.

[31417] GAM2253 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2253 target RNA, herein designated GAM TARGET RNA. GAM2253 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31418] GAM2253 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2253 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2253 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2253 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2253 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31419] The complementary binding of GAM2253 RNA, herein designated GAM RNA, to target binding sites on GAM2253 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2253 target RNA, herein designated GAM TARGET RNA, into GAM2253 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31420] It is appreciated that GAM2253 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2253 target genes. The

mRNA of each one of this plurality of GAM2253 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2253 RNA, herein designated GAM RNA, and which when bound by GAM2253 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2253 target proteins.

[31421] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2253 gene, herein designated GAM GENE, on one or more GAM2253 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31422] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2253 correlate with, and may be deduced from, the identity of the target genes which GAM2253 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31423] Nucleotide sequences of the GAM2253 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2253 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2253 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2253 are further described hereinbelow with reference to Table 1.

[31424] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2253 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31425] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2254 (GAM2254) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31426] GAM2254 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2254 was detected is described hereinabove with reference to Figs. 2-8.

[31427] GAM2254 gene, herein designated GAM GENE, and GAM2254 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31428] GAM2254 gene, herein designated GAM GENE, encodes a GAM2254 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2254 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2254 precursor RNA is designated SEQ ID:2231, and is provided hereinbelow with reference to the sequence listing part.

[31429] GAM2254 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31430] An enzyme complex designated DICER COMPLEX, dices the GAM2254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2254 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM2254 RNA is designated SEQ ID:4845, and is provided hereinbelow with reference to the sequence listing part.

[31431] GAM2254 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2254 target RNA, herein designated GAM TARGET RNA. GAM2254 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31432] GAM2254 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2254 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2254 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2254 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2254 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31433] The complementary binding of GAM2254 RNA, herein designated GAM RNA, to target binding sites on GAM2254 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2254 target RNA, herein designated GAM TARGET RNA, into GAM2254 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31434] It is appreciated that GAM2254 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2254 target genes. The mRNA of each one of this plurality of GAM2254 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2254 RNA, herein designated GAM RNA, and which when bound by GAM2254 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2254 target proteins.

[31435] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2254 gene, herein designated GAM GENE, on one or more GAM2254 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31436] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2254 correlate with, and may be deduced from, the identity of the target

genes which GAM2254 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31437] Nucleotide sequences of the GAM2254 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2254 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2254 are further described hereinbelow with reference to Table 1.

[31438] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2254 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31439] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2255 (GAM2255) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31440] GAM2255 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2255 was detected is described hereinabove with reference to Figs. 2-8.

[31441] GAM2255 gene, herein designated GAM GENE, and GAM2255 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[31442] GAM2255 gene, herein designated GAM GENE, encodes a GAM2255 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2255 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2255 precursor RNA is designated SEQ ID:2232, and is provided hereinbelow with reference to the sequence listing part.

[31443] GAM2255 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31444] An enzyme complex designated DICER COMPLEX, dices the GAM2255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2255 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2255 RNA is designated SEQ ID:4846, and is provided

hereinbelow with reference to the sequence listing part.

[31445] GAM2255 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2255 target RNA, herein designated GAM TARGET RNA. GAM2255 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31446] GAM2255 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2255 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2255 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2255 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2255 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31447] The complementary binding of GAM2255 RNA, herein designated GAM RNA, to target binding sites on GAM2255 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2255 target RNA, herein designated GAM TARGET RNA, into GAM2255 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31448] It is appreciated that GAM2255 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2255 target genes. The mRNA of each one of this plurality of GAM2255 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2255 RNA, herein designated GAM RNA, and which when bound by GAM2255 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2255 target proteins.

[31449] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2255 gene, herein designated GAM GENE, on one or more GAM2255 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31450] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2255 correlate with, and may be deduced from, the identity of the target genes which GAM2255 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31451] Nucleotide sequences of the GAM2255 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2255 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2255 are further described hereinbelow with reference to Table 1.

[31452] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2255 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31453] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2256 (GAM2256) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31454] GAM2256 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2256 was detected is described hereinabove with reference to Figs. 2-8.

[31455] GAM2256 gene, herein designated GAM GENE, and GAM2256 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31456] GAM2256 gene, herein designated GAM GENE, encodes a GAM2256 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2256 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2256 precursor RNA is designated SEQ ID:2233, and is provided hereinbelow with reference to the sequence listing part.

[31457] GAM2256 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2256 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31458] An enzyme complex designated DICER COMPLEX, dices the GAM2256 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2256 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2256 RNA is designated SEQ ID:4847, and is provided hereinbelow with reference to the sequence listing part.

[31459] GAM2256 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2256 target RNA, herein designated GAM TARGET RNA. GAM2256 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31460] GAM2256 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2256 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2256 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2256 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2256 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31461] The complementary binding of GAM2256 RNA, herein designated GAM RNA, to target binding sites on GAM2256 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2256 target RNA, herein designated GAM TARGET RNA, into GAM2256 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31462] It is appreciated that GAM2256 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2256 target genes. The mRNA of each one of this plurality of GAM2256 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2256 RNA, herein designated GAM RNA, and which when bound by GAM2256 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2256 target proteins.

[31463] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2256 gene, herein designated GAM GENE, on one or more GAM2256 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31464] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2256 correlate with, and may be deduced from, the identity of the target genes which GAM2256 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31465] Nucleotide sequences of the GAM2256 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2256 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2256 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2256 are further described hereinbelow with reference to Table 1.

[31466] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2256 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31467] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2257 (GAM2257) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31468] GAM2257 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2257 was detected is described hereinabove with reference to Figs. 2-8.

[31469] GAM2257 gene, herein designated GAM GENE, and GAM2257 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31470] GAM2257 gene, herein designated GAM GENE, encodes a GAM2257 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2257 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2257 precursor RNA is designated SEQ ID:2234, and is provided hereinbelow with reference to the sequence listing part.

[31471] GAM2257 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [31472] An enzyme complex designated DICER COMPLEX, dices the GAM2257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2257 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2257 RNA is designated SEQ ID:4848, and is provided hereinbelow with reference to the sequence listing part.
- [31473] GAM2257 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2257 target RNA, herein designated GAM TARGET RNA. GAM2257 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [31474] GAM2257 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2257 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2257 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2257 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2257 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31475] The complementary binding of GAM2257 RNA, herein designated GAM RNA, to target binding sites on GAM2257 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2257 target RNA, herein designated GAM TARGET RNA, into GAM2257 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31476] It is appreciated that GAM2257 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2257 target genes. The mRNA of each one of this plurality of GAM2257 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2257 RNA, herein designated GAM RNA, and which when bound by GAM2257 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2257 target proteins.

[31477] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2257 gene, herein designated GAM GENE, on one or more GAM2257 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31478] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2257 correlate with, and may be deduced from, the identity of the target genes which GAM2257 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31479] Nucleotide sequences of the GAM2257 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2257 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2257 are further described hereinbelow with reference to Table 1.

[31480] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2257 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[31481] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2258 (GAM2258) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31482] GAM2258 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2258 was detected is described hereinabove with reference to Figs. 2-8.

[31483] GAM2258 gene, herein designated GAM GENE, and GAM2258 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31484] GAM2258 gene, herein designated GAM GENE, encodes a GAM2258 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2258 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2258 precursor RNA is designated SEQ ID:2235, and is provided hereinbelow with reference to the sequence listing part.

[31485] GAM2258 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2258 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31486] An enzyme complex designated DICER COMPLEX, dices the GAM2258 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2258 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2258 RNA is designated SEQ ID:4849, and is provided hereinbelow with reference to the sequence listing part.

[31487] GAM2258 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2258 target RNA, herein designated GAM TARGET RNA. GAM2258 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31488] GAM2258 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2258 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2258 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2258 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2258 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31489] The complementary binding of GAM2258 RNA, herein designated GAM RNA, to target binding sites on GAM2258 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2258 target RNA, herein designated GAM TARGET RNA, into GAM2258 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31490] It is appreciated that GAM2258 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2258 target genes. The mRNA of each one of this plurality of GAM2258 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2258 RNA, herein designated GAM RNA, and which when bound by GAM2258 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2258 target proteins.

[31491] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2258 gene, herein designated GAM GENE, on one or more GAM2258 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31492] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2258 correlate with, and may be deduced from, the identity of the target genes which GAM2258 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31493] Nucleotide sequences of the GAM2258 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2258 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2258 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2258 are further described hereinbelow with reference to Table 1.

- [31494] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2258 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [31495] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2259 (GAM2259) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [31496] GAM2259 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2259 was detected is described hereinabove with reference to Figs. 2-8.
- [31497] GAM2259 gene, herein designated GAM GENE, and GAM2259 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [31498] GAM2259 gene, herein designated GAM GENE, encodes a GAM2259 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2259 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2259 precursor RNA is designated SEQ ID:2236, and is provided hereinbelow with reference to the sequence listing part.

[31499] GAM2259 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2259 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31500] An enzyme complex designated DICER COMPLEX, dices the GAM2259 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2259 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2259 RNA is designated SEQ ID:4851, and is provided hereinbelow with reference to the sequence listing part.

[31501] GAM2259 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2259 target RNA, herein designated GAM TARGET RNA. GAM2259 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31502] GAM2259 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2259 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2259 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2259 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2259 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31503] The complementary binding of GAM2259 RNA, herein designated GAM RNA, to target binding sites on GAM2259 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2259 target RNA, herein designated GAM TARGET RNA, into GAM2259 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31504] It is appreciated that GAM2259 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2259 target genes. The

mRNA of each one of this plurality of GAM2259 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2259 RNA, herein designated GAM RNA, and which when bound by GAM2259 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2259 target proteins.

[31505] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2259 gene, herein designated GAM GENE, on one or more GAM2259 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31506] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2259 correlate with, and may be deduced from, the identity of the target genes which GAM2259 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31507] Nucleotide sequences of the GAM2259 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2259 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2259 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2259 are further described hereinbelow with reference to Table 1.

[31508] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2259 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31509] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2260 (GAM2260) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31510] GAM2260 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2260 was detected is described hereinabove with reference to Figs. 2-8.

[31511] GAM2260 gene, herein designated GAM GENE, and GAM2260 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31512] GAM2260 gene, herein designated GAM GENE, encodes a GAM2260 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2260 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2260 precursor RNA is designated SEQ ID:2237, and is provided hereinbelow with reference to the sequence listing part.

[31513] GAM2260 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31514] An enzyme complex designated DICER COMPLEX, dices the GAM2260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2260 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2260 RNA is designated SEQ ID:4850, and is provided hereinbelow with reference to the sequence listing part.

[31515] GAM2260 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2260 target RNA, herein designated GAM TARGET RNA. GAM2260 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31516] GAM2260 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2260 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2260 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2260 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2260 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31517] The complementary binding of GAM2260 RNA, herein designated GAM RNA, to target binding sites on GAM2260 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2260 target RNA, herein designated GAM TARGET RNA, into GAM2260 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31518] It is appreciated that GAM2260 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2260 target genes. The mRNA of each one of this plurality of GAM2260 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2260 RNA, herein designated GAM RNA, and which when bound by GAM2260 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2260 target proteins.

[31519] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2260 gene, herein designated GAM GENE, on one or more GAM2260 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31520] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2260 correlate with, and may be deduced from, the identity of the target

genes which GAM2260 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31521] Nucleotide sequences of the GAM2260 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2260 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2260 are further described hereinbelow with reference to Table 1.

[31522] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2260 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31523] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2261 (GAM2261) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31524] GAM2261 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2261 was detected is described hereinabove with reference to Figs. 2-8.

[31525] GAM2261 gene, herein designated GAM GENE, and GAM2261 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[31526] GAM2261 gene, herein designated GAM GENE, encodes a GAM2261 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2261 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2261 precursor RNA is designated SEQ ID:2238, and is provided hereinbelow with reference to the sequence listing part.

[31527] GAM2261 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2261 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31528] An enzyme complex designated DICER COMPLEX, dices the GAM2261 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2261 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2261 RNA is designated SEQ ID:4852, and is provided

hereinbelow with reference to the sequence listing part.

[31529] GAM2261 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2261 target RNA, herein designated GAM TARGET RNA. GAM2261 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31530] GAM2261 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2261 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2261 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2261 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2261 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31531] The complementary binding of GAM2261 RNA, herein designated GAM RNA, to target binding sites on GAM2261 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2261 target RNA, herein designated GAM TARGET RNA, into GAM2261 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31532] It is appreciated that GAM2261 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2261 target genes. The mRNA of each one of this plurality of GAM2261 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2261 RNA, herein designated GAM RNA, and which when bound by GAM2261 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2261 target proteins.

[31533] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2261 gene, herein designated GAM GENE, on one or more GAM2261 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31534] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2261 correlate with, and may be deduced from, the identity of the target genes which GAM2261 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31535] Nucleotide sequences of the GAM2261 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2261 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2261 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2261 are further described hereinbelow with reference to Table 1.

[31536] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2261 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31537] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2262 (GAM2262) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31538] GAM2262 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2262 was detected is described hereinabove with reference to Figs. 2-8.

[31539] GAM2262 gene, herein designated GAM GENE, and GAM2262 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31540] GAM2262 gene, herein designated GAM GENE, encodes a GAM2262 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2262 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2262 precursor RNA is designated SEQ ID:2239, and is provided hereinbelow with reference to the sequence listing part.

[31541] GAM2262 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2262 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31542] An enzyme complex designated DICER COMPLEX, dices the GAM2262 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2262 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2262 RNA is designated SEQ ID:4853, and is provided hereinbelow with reference to the sequence listing part.

[31543] GAM2262 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2262 target RNA, herein designated GAM TARGET RNA. GAM2262 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31544] GAM2262 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2262 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2262 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2262 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2262 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31545] The complementary binding of GAM2262 RNA, herein designated GAM RNA, to target binding sites on GAM2262 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2262 target RNA, herein designated GAM TARGET RNA, into GAM2262 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31546] It is appreciated that GAM2262 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2262 target genes. The mRNA of each one of this plurality of GAM2262 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2262 RNA, herein designated GAM RNA, and which when bound by GAM2262 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2262 target proteins.

[31547] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2262 gene, herein designated GAM GENE, on one or more GAM2262 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31548] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2262 correlate with, and may be deduced from, the identity of the target genes which GAM2262 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31549] Nucleotide sequences of the GAM2262 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2262 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2262 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2262 are further described hereinbelow with reference to Table 1.

[31550] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2262 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31551] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2263 (GAM2263) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31552] GAM2263 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2263 was detected is described hereinabove with reference to Figs. 2-8.

[31553] GAM2263 gene, herein designated GAM GENE, and GAM2263 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31554] GAM2263 gene, herein designated GAM GENE, encodes a GAM2263 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2263 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2263 precursor RNA is designated SEQ ID:2240, and is provided hereinbelow with reference to the sequence listing part.

[31555] GAM2263 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [31556] An enzyme complex designated DICER COMPLEX, dices the GAM2263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2263 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2263 RNA is designated SEQ ID:4854, and is provided hereinbelow with reference to the sequence listing part.
- [31557] GAM2263 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2263 target RNA, herein designated GAM TARGET RNA. GAM2263 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [31558] GAM2263 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2263 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2263 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2263 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2263 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31559] The complementary binding of GAM2263 RNA, herein designated GAM RNA, to target binding sites on GAM2263 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2263 target RNA, herein designated GAM TARGET RNA, into GAM2263 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31560] It is appreciated that GAM2263 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2263 target genes. The mRNA of each one of this plurality of GAM2263 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2263 RNA, herein designated GAM RNA, and which when bound by GAM2263 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2263 target proteins.

[31561] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2263 gene, herein designated GAM GENE, on one or more GAM2263 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31562] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2263 correlate with, and may be deduced from, the identity of the target genes which GAM2263 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31563] Nucleotide sequences of the GAM2263 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2263 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2263 are further described hereinbelow with reference to Table 1.

[31564] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2263 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[31565] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2264 (GAM2264) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31566] GAM2264 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2264 was detected is described hereinabove with reference to Figs. 2-8.

[31567] GAM2264 gene, herein designated GAM GENE, and GAM2264 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31568] GAM2264 gene, herein designated GAM GENE, encodes a GAM2264 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2264 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2264 precursor RNA is designated SEQ ID:2241, and is provided hereinbelow with reference to the sequence listing part.

[31569] GAM2264 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31570] An enzyme complex designated DICER COMPLEX, dices the GAM2264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2264 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2264 RNA is designated SEQ ID:4856, and is provided hereinbelow with reference to the sequence listing part.

[31571] GAM2264 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2264 target RNA, herein designated GAM TARGET RNA. GAM2264 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31572] GAM2264 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2264 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2264 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2264 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2264 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31573] The complementary binding of GAM2264 RNA, herein designated GAM RNA, to target binding sites on GAM2264 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2264 target RNA, herein designated GAM TARGET RNA, into GAM2264 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31574] It is appreciated that GAM2264 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2264 target genes. The mRNA of each one of this plurality of GAM2264 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2264 RNA, herein designated GAM RNA, and which when bound by GAM2264 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2264 target proteins.

[31575] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2264 gene, herein designated GAM GENE, on one or more GAM2264 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31576] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2264 correlate with, and may be deduced from, the identity of the target genes which GAM2264 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31577] Nucleotide sequences of the GAM2264 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2264 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2264 are further described hereinbelow with reference to Table 1.

[31578] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2264 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31579] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2265 (GAM2265) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31580] GAM2265 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2265 was detected is described hereinabove with reference to Figs. 2-8.

[31581] GAM2265 gene, herein designated GAM GENE, and GAM2265 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31582] GAM2265 gene, herein designated GAM GENE, encodes a GAM2265 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2265 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2265 precursor RNA is designated SEQ ID:2242, and is provided hereinbelow with reference to the sequence listing part.

[31583] GAM2265 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31584] An enzyme complex designated DICER COMPLEX, dices the GAM2265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2265 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2265 RNA is designated SEQ ID:4855, and is provided hereinbelow with reference to the sequence listing part.

[31585] GAM2265 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2265 target RNA, herein designated GAM TARGET RNA. GAM2265 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31586] GAM2265 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2265 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2265 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2265 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2265 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31587] The complementary binding of GAM2265 RNA, herein designated GAM RNA, to target binding sites on GAM2265 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2265 target RNA, herein designated GAM TARGET RNA, into GAM2265 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31588] It is appreciated that GAM2265 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2265 target genes. The

mRNA of each one of this plurality of GAM2265 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2265 RNA, herein designated GAM RNA, and which when bound by GAM2265 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2265 target proteins.

[31589] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2265 gene, herein designated GAM GENE, on one or more GAM2265 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31590] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2265 correlate with, and may be deduced from, the identity of the target genes which GAM2265 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31591] Nucleotide sequences of the GAM2265 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2265 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2265 are further described hereinbelow with reference to Table 1.

[31592] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2265 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31593] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2266 (GAM2266) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31594] GAM2266 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2266 was detected is described hereinabove with reference to Figs. 2-8.

[31595] GAM2266 gene, herein designated GAM GENE, and GAM2266 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31596] GAM2266 gene, herein designated GAM GENE, encodes a GAM2266 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2266 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2266 precursor RNA is designated SEQ ID:2243, and is provided hereinbelow with reference to the sequence listing part.

[31597] GAM2266 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31598] An enzyme complex designated DICER COMPLEX, dices the GAM2266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2266 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2266 RNA is designated SEQ ID:4857, and is provided hereinbelow with reference to the sequence listing part.

[31599] GAM2266 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2266 target RNA, herein designated GAM TARGET RNA. GAM2266 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31600] GAM2266 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2266 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2266 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2266 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2266 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31601] The complementary binding of GAM2266 RNA, herein designated GAM RNA, to target binding sites on GAM2266 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2266 target RNA, herein designated GAM TARGET RNA, into GAM2266 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31602] It is appreciated that GAM2266 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2266 target genes. The mRNA of each one of this plurality of GAM2266 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2266 RNA, herein designated GAM RNA, and which when bound by GAM2266 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2266 target proteins.

[31603] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2266 gene, herein designated GAM GENE, on one or more GAM2266 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31604] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2266 correlate with, and may be deduced from, the identity of the target

genes which GAM2266 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31605] Nucleotide sequences of the GAM2266 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2266 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2266 are further described hereinbelow with reference to Table 1.

[31606] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2266 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31607] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2267 (GAM2267) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31608] GAM2267 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2267 was detected is described hereinabove with reference to Figs. 2-8.

[31609] GAM2267 gene, herein designated GAM GENE, and GAM2267 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[31610] GAM2267 gene, herein designated GAM GENE, encodes a GAM2267 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2267 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2267 precursor RNA is designated SEQ ID:2244, and is provided hereinbelow with reference to the sequence listing part.

[31611] GAM2267 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31612] An enzyme complex designated DICER COMPLEX, dices the GAM2267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2267 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2267 RNA is designated SEQ ID:4858, and is provided

hereinbelow with reference to the sequence listing part.

[31613] GAM2267 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2267 target RNA, herein designated GAM TARGET RNA. GAM2267 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31614] GAM2267 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2267 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2267 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2267 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2267 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31615] The complementary binding of GAM2267 RNA, herein designated GAM RNA, to target binding sites on GAM2267 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2267 target RNA, herein designated GAM TARGET RNA, into GAM2267 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31616] It is appreciated that GAM2267 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2267 target genes. The mRNA of each one of this plurality of GAM2267 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2267 RNA, herein designated GAM RNA, and which when bound by GAM2267 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2267 target proteins.

[31617] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2267 gene, herein designated GAM GENE, on one or more GAM2267 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31618] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2267 correlate with, and may be deduced from, the identity of the target genes which GAM2267 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31619] Nucleotide sequences of the GAM2267 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2267 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2267 are further described hereinbelow with reference to Table 1.

[31620] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2267 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31621] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2268 (GAM2268) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31622] GAM2268 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2268 was detected is described hereinabove with reference to Figs. 2-8.

[31623] GAM2268 gene, herein designated GAM GENE, and GAM2268 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31624] GAM2268 gene, herein designated GAM GENE, encodes a GAM2268 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2268 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2268 precursor RNA is designated SEQ ID:2245, and is provided hereinbelow with reference to the sequence listing part.

[31625] GAM2268 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2268 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31626] An enzyme complex designated DICER COMPLEX, dices the GAM2268 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2268 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2268 RNA is designated SEQ ID:4859, and is provided hereinbelow with reference to the sequence listing part.

[31627] GAM2268 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2268 target RNA, herein designated GAM TARGET RNA. GAM2268 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31628] GAM2268 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2268 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2268 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2268 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2268 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31629] The complementary binding of GAM2268 RNA, herein designated GAM RNA, to target binding sites on GAM2268 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2268 target RNA, herein designated GAM TARGET RNA, into GAM2268 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31630] It is appreciated that GAM2268 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2268 target genes. The mRNA of each one of this plurality of GAM2268 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2268 RNA, herein designated GAM RNA, and which when bound by GAM2268 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2268 target proteins.

[31631] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2268 gene, herein designated GAM GENE, on one or more GAM2268 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31632] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2268 correlate with, and may be deduced from, the identity of the target genes which GAM2268 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31633] Nucleotide sequences of the GAM2268 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2268 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2268 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2268 are further described hereinbelow with reference to Table 1.

[31634] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2268 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31635] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2269 (GAM2269) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31636] GAM2269 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2269 was detected is described hereinabove with reference to Figs. 2-8.

[31637] GAM2269 gene, herein designated GAM GENE, and GAM2269 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31638] GAM2269 gene, herein designated GAM GENE, encodes a GAM2269 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2269 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2269 precursor RNA is designated SEQ ID:2246, and is provided hereinbelow with reference to the sequence listing part.

[31639] GAM2269 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2269 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [31640] An enzyme complex designated DICER COMPLEX, dices the GAM2269 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2269 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2269 RNA is designated SEQ ID:4860, and is provided hereinbelow with reference to the sequence listing part.
- [31641] GAM2269 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2269 target RNA, herein designated GAM TARGET RNA. GAM2269 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [31642] GAM2269 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2269 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2269 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2269 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2269 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31643] The complementary binding of GAM2269 RNA, herein designated GAM RNA, to target binding sites on GAM2269 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2269 target RNA, herein designated GAM TARGET RNA, into GAM2269 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31644] It is appreciated that GAM2269 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2269 target genes. The mRNA of each one of this plurality of GAM2269 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2269 RNA, herein designated GAM RNA, and which when bound by GAM2269 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2269 target proteins.

[31645] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2269 gene, herein designated GAM GENE, on one or more GAM2269 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31646] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2269 correlate with, and may be deduced from, the identity of the target genes which GAM2269 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31647] Nucleotide sequences of the GAM2269 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2269 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2269 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2269 are further described hereinbelow with reference to Table 1.

[31648] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2269 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[31649] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2270 (GAM2270) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31650] GAM2270 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2270 was detected is described hereinabove with reference to Figs. 2-8.

[31651] GAM2270 gene, herein designated GAM GENE, and GAM2270 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31652] GAM2270 gene, herein designated GAM GENE, encodes a GAM2270 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2270 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2270 precursor RNA is designated SEQ ID:2247, and is provided hereinbelow with reference to the sequence listing part.

[31653] GAM2270 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31654] An enzyme complex designated DICER COMPLEX, dices the GAM2270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2270 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2270 RNA is designated SEQ ID:4861, and is provided hereinbelow with reference to the sequence listing part.

[31655] GAM2270 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2270 target RNA, herein designated GAM TARGET RNA. GAM2270 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31656] GAM2270 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2270 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2270 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2270 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2270 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31657] The complementary binding of GAM2270 RNA, herein designated GAM RNA, to target binding sites on GAM2270 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2270 target RNA, herein designated GAM TARGET RNA, into GAM2270 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31658] It is appreciated that GAM2270 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2270 target genes. The mRNA of each one of this plurality of GAM2270 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2270 RNA, herein designated GAM RNA, and which when bound by GAM2270 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2270 target proteins.

[31659] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2270 gene, herein designated GAM GENE, on one or more GAM2270 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31660] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2270 correlate with, and may be deduced from, the identity of the target genes which GAM2270 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31661] Nucleotide sequences of the GAM2270 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2270 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2270 are further described hereinbelow with reference to Table 1.

[31662] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2270 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31663] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2271 (GAM2271) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31664] GAM2271 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2271 was detected is described hereinabove with reference to Figs. 2-8.

[31665] GAM2271 gene, herein designated GAM GENE, and GAM2271 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31666] GAM2271 gene, herein designated GAM GENE, encodes a GAM2271 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2271 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2271 precursor RNA is designated SEQ ID:2248, and is provided hereinbelow with reference to the sequence listing part.

[31667] GAM2271 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31668] An enzyme complex designated DICER COMPLEX, dices the GAM2271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2271 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2271 RNA is designated SEQ ID:4862, and is provided hereinbelow with reference to the sequence listing part.

[31669] GAM2271 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2271 target RNA, herein designated GAM TARGET RNA. GAM2271 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31670] GAM2271 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2271 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2271 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2271 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2271 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31671] The complementary binding of GAM2271 RNA, herein designated GAM RNA, to target binding sites on GAM2271 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2271 target RNA, herein designated GAM TARGET RNA, into GAM2271 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31672] It is appreciated that GAM2271 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2271 target genes. The

mRNA of each one of this plurality of GAM2271 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2271 RNA, herein designated GAM RNA, and which when bound by GAM2271 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2271 target proteins.

[31673] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2271 gene, herein designated GAM GENE, on one or more GAM2271 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31674] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2271 correlate with, and may be deduced from, the identity of the target genes which GAM2271 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31675] Nucleotide sequences of the GAM2271 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2271 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2271 are further described hereinbelow with reference to Table 1.

[31676] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2271 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31677] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2272 (GAM2272) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31678] GAM2272 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2272 was detected is described hereinabove with reference to Figs. 2-8.

[31679] GAM2272 gene, herein designated GAM GENE, and GAM2272 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31680] GAM2272 gene, herein designated GAM GENE, encodes a GAM2272 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2272 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2272 precursor RNA is designated SEQ ID:2249, and is provided hereinbelow with reference to the sequence listing part.

[31681] GAM2272 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31682] An enzyme complex designated DICER COMPLEX, dices the GAM2272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2272 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2272 RNA is designated SEQ ID:4863, and is provided hereinbelow with reference to the sequence listing part.

[31683] GAM2272 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2272 target RNA, herein designated GAM TARGET RNA. GAM2272 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31684] GAM2272 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2272 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2272 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2272 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2272 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31685] The complementary binding of GAM2272 RNA, herein designated GAM RNA, to target binding sites on GAM2272 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2272 target RNA, herein designated GAM TARGET RNA, into GAM2272 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31686] It is appreciated that GAM2272 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2272 target genes. The mRNA of each one of this plurality of GAM2272 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2272 RNA, herein designated GAM RNA, and which when bound by GAM2272 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2272 target proteins.

[31687] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2272 gene, herein designated GAM GENE, on one or more GAM2272 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31688] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2272 correlate with, and may be deduced from, the identity of the target

genes which GAM2272 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31689] Nucleotide sequences of the GAM2272 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2272 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2272 are further described hereinbelow with reference to Table 1.

[31690] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2272 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31691] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2273 (GAM2273) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31692] GAM2273 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2273 was detected is described hereinabove with reference to Figs. 2-8.

[31693] GAM2273 gene, herein designated GAM GENE, and GAM2273 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[31694] GAM2273 gene, herein designated GAM GENE, encodes a GAM2273 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2273 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2273 precursor RNA is designated SEQ ID:2250, and is provided hereinbelow with reference to the sequence listing part.

[31695] GAM2273 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2273 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31696] An enzyme complex designated DICER COMPLEX, dices the GAM2273 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2273 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2273 RNA is designated SEQ ID:4864, and is provided

hereinbelow with reference to the sequence listing part.

[31697] GAM2273 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2273 target RNA, herein designated GAM TARGET RNA. GAM2273 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31698] GAM2273 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2273 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2273 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2273 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2273 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31699] The complementary binding of GAM2273 RNA, herein designated GAM RNA, to target binding sites on GAM2273 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2273 target RNA, herein designated GAM TARGET RNA, into GAM2273 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31700] It is appreciated that GAM2273 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2273 target genes. The mRNA of each one of this plurality of GAM2273 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2273 RNA, herein designated GAM RNA, and which when bound by GAM2273 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2273 target proteins.

[31701] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2273 gene, herein designated GAM GENE, on one or more GAM2273 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31702] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2273 correlate with, and may be deduced from, the identity of the target genes which GAM2273 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31703] Nucleotide sequences of the GAM2273 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2273 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2273 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2273 are further described hereinbelow with reference to Table 1.

[31704] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2273 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31705] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2274 (GAM2274) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31706] GAM2274 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2274 was detected is described hereinabove with reference to Figs. 2-8.

[31707] GAM2274 gene, herein designated GAM GENE, and GAM2274 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31708] GAM2274 gene, herein designated GAM GENE, encodes a GAM2274 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2274 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2274 precursor RNA is designated SEQ ID:2251, and is provided hereinbelow with reference to the sequence listing part.

[31709] GAM2274 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2274 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31710] An enzyme complex designated DICER COMPLEX, dices the GAM2274 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2274 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2274 RNA is designated SEQ ID:4865, and is provided hereinbelow with reference to the sequence listing part.

[31711] GAM2274 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2274 target RNA, herein designated GAM TARGET RNA. GAM2274 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31712] GAM2274 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2274 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2274 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2274 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2274 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31713] The complementary binding of GAM2274 RNA, herein designated GAM RNA, to target binding sites on GAM2274 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2274 target RNA, herein designated GAM TARGET RNA, into GAM2274 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31714] It is appreciated that GAM2274 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2274 target genes. The mRNA of each one of this plurality of GAM2274 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2274 RNA, herein designated GAM RNA, and which when bound by GAM2274 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2274 target proteins.

[31715] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2274 gene, herein designated GAM GENE, on one or more GAM2274 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31716] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2274 correlate with, and may be deduced from, the identity of the target genes which GAM2274 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31717] Nucleotide sequences of the GAM2274 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2274 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2274 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2274 are further described hereinbelow with reference to Table 1.

[31718] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2274 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31719] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2275 (GAM2275) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31720] GAM2275 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2275 was detected is described hereinabove with reference to Figs. 2-8.

[31721] GAM2275 gene, herein designated GAM GENE, and GAM2275 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31722] GAM2275 gene, herein designated GAM GENE, encodes a GAM2275 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2275 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2275 precursor RNA is designated SEQ ID:2252, and is provided hereinbelow with reference to the sequence listing part.

[31723] GAM2275 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [31724] An enzyme complex designated DICER COMPLEX, dices the GAM2275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2275 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2275 RNA is designated SEQ ID:4866, and is provided hereinbelow with reference to the sequence listing part.
- [31725] GAM2275 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2275 target RNA, herein designated GAM TARGET RNA. GAM2275 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [31726] GAM2275 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2275 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2275 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2275 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2275 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31727] The complementary binding of GAM2275 RNA, herein designated GAM RNA, to target binding sites on GAM2275 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2275 target RNA, herein designated GAM TARGET RNA, into GAM2275 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31728] It is appreciated that GAM2275 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2275 target genes. The mRNA of each one of this plurality of GAM2275 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2275 RNA, herein designated GAM RNA, and which when bound by GAM2275 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2275 target proteins.

[31729] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2275 gene, herein designated GAM GENE, on one or more GAM2275 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31730] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2275 correlate with, and may be deduced from, the identity of the target genes which GAM2275 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31731] Nucleotide sequences of the GAM2275 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2275 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2275 are further described hereinbelow with reference to Table 1.

[31732] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2275 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[31733] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2276 (GAM2276) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31734] GAM2276 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2276 was detected is described hereinabove with reference to Figs. 2-8.

[31735] GAM2276 gene, herein designated GAM GENE, and GAM2276 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31736] GAM2276 gene, herein designated GAM GENE, encodes a GAM2276 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2276 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2276 precursor RNA is designated SEQ ID:2253, and is provided hereinbelow with reference to the sequence listing part.

[31737] GAM2276 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2276 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31738] An enzyme complex designated DICER COMPLEX, dices the GAM2276 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2276 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2276 RNA is designated SEQ ID:4868, and is provided hereinbelow with reference to the sequence listing part.

[31739] GAM2276 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2276 target RNA, herein designated GAM TARGET RNA. GAM2276 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31740] GAM2276 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2276 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2276 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2276 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2276 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31741] The complementary binding of GAM2276 RNA, herein designated GAM RNA, to target binding sites on GAM2276 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2276 target RNA, herein designated GAM TARGET RNA, into GAM2276 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31742] It is appreciated that GAM2276 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2276 target genes. The mRNA of each one of this plurality of GAM2276 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2276 RNA, herein designated GAM RNA, and which when bound by GAM2276 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2276 target proteins.

[31743] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2276 gene, herein designated GAM GENE, on one or more GAM2276 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31744] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2276 correlate with, and may be deduced from, the identity of the target genes which GAM2276 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31745] Nucleotide sequences of the GAM2276 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2276 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2276 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2276 are further described hereinbelow with reference to Table 1.

[31746] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2276 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31747] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2277 (GAM2277) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31748] GAM2277 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2277 was detected is described hereinabove with reference to Figs. 2-8.

[31749] GAM2277 gene, herein designated GAM GENE, and GAM2277 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31750] GAM2277 gene, herein designated GAM GENE, encodes a GAM2277 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2277 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2277 precursor RNA is designated SEQ ID:2254, and is provided hereinbelow with reference to the sequence listing part.

[31751] GAM2277 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2277 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31752] An enzyme complex designated DICER COMPLEX, dices the GAM2277 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2277 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2277 RNA is designated SEQ ID:4867, and is provided hereinbelow with reference to the sequence listing part.

[31753] GAM2277 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2277 target RNA, herein designated GAM TARGET RNA. GAM2277 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31754] GAM2277 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2277 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2277 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2277 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2277 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31755] The complementary binding of GAM2277 RNA, herein designated GAM RNA, to target binding sites on GAM2277 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2277 target RNA, herein designated GAM TARGET RNA, into GAM2277 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31756] It is appreciated that GAM2277 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2277 target genes. The

mRNA of each one of this plurality of GAM2277 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2277 RNA, herein designated GAM RNA, and which when bound by GAM2277 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2277 target proteins.

[31757] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2277 gene, herein designated GAM GENE, on one or more GAM2277 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31758] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2277 correlate with, and may be deduced from, the identity of the target genes which GAM2277 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31759] Nucleotide sequences of the GAM2277 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2277 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2277 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2277 are further described hereinbelow with reference to Table 1.

[31760] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2277 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31761] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2278 (GAM2278) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31762] GAM2278 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2278 was detected is described hereinabove with reference to Figs. 2-8.

[31763] GAM2278 gene, herein designated GAM GENE, and GAM2278 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31764] GAM2278 gene, herein designated GAM GENE, encodes a GAM2278 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2278 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2278 precursor RNA is designated SEQ ID:2255, and is provided hereinbelow with reference to the sequence listing part.

[31765] GAM2278 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31766] An enzyme complex designated DICER COMPLEX, dices the GAM2278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2278 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM2278 RNA is designated SEQ ID:4869, and is provided hereinbelow with reference to the sequence listing part.

[31767] GAM2278 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2278 target RNA, herein designated GAM TARGET RNA. GAM2278 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31768] GAM2278 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2278 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2278 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2278 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2278 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31769] The complementary binding of GAM2278 RNA, herein designated GAM RNA, to target binding sites on GAM2278 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2278 target RNA, herein designated GAM TARGET RNA, into GAM2278 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31770] It is appreciated that GAM2278 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2278 target genes. The mRNA of each one of this plurality of GAM2278 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2278 RNA, herein designated GAM RNA, and which when bound by GAM2278 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2278 target proteins.

[31771] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2278 gene, herein designated GAM GENE, on one or more GAM2278 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31772] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2278 correlate with, and may be deduced from, the identity of the target

genes which GAM2278 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31773] Nucleotide sequences of the GAM2278 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2278 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2278 are further described hereinbelow with reference to Table 1.

[31774] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2278 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31775] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2279 (GAM2279) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31776] GAM2279 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2279 was detected is described hereinabove with reference to Figs. 2-8.

[31777] GAM2279 gene, herein designated GAM GENE, and GAM2279 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[31778] GAM2279 gene, herein designated GAM GENE, encodes a GAM2279 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2279 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2279 precursor RNA is designated SEQ ID:2256, and is provided hereinbelow with reference to the sequence listing part.

[31779] GAM2279 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31780] An enzyme complex designated DICER COMPLEX, dices the GAM2279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2279 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2279 RNA is designated SEQ ID:4870, and is provided

hereinbelow with reference to the sequence listing part.

[31781] GAM2279 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2279 target RNA, herein designated GAM TARGET RNA. GAM2279 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31782] GAM2279 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2279 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2279 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2279 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2279 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31783] The complementary binding of GAM2279 RNA, herein designated GAM RNA, to target binding sites on GAM2279 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2279 target RNA, herein designated GAM TARGET RNA, into GAM2279 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31784] It is appreciated that GAM2279 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2279 target genes. The mRNA of each one of this plurality of GAM2279 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2279 RNA, herein designated GAM RNA, and which when bound by GAM2279 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2279 target proteins.

[31785] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2279 gene, herein designated GAM GENE, on one or more GAM2279 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31786] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2279 correlate with, and may be deduced from, the identity of the target genes which GAM2279 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31787] Nucleotide sequences of the GAM2279 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2279 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2279 are further described hereinbelow with reference to Table 1.

[31788] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2279 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31789] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2280 (GAM2280) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31790] GAM2280 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2280 was detected is described hereinabove with reference to Figs. 2-8.

[31791] GAM2280 gene, herein designated GAM GENE, and GAM2280 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31792] GAM2280 gene, herein designated GAM GENE, encodes a GAM2280 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2280 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2280 precursor RNA is designated SEQ ID:2257, and is provided hereinbelow with reference to the sequence listing part.

[31793] GAM2280 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2280 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31794] An enzyme complex designated DICER COMPLEX, dices the GAM2280 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2280 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2280 RNA is designated SEQ ID:4871, and is provided hereinbelow with reference to the sequence listing part.

[31795] GAM2280 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2280 target RNA, herein designated GAM TARGET RNA. GAM2280 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31796] GAM2280 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2280 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2280 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2280 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2280 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31797] The complementary binding of GAM2280 RNA, herein designated GAM RNA, to target binding sites on GAM2280 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2280 target RNA, herein designated GAM TARGET RNA, into GAM2280 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31798] It is appreciated that GAM2280 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2280 target genes. The mRNA of each one of this plurality of GAM2280 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2280 RNA, herein designated GAM RNA, and which when bound by GAM2280 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2280 target proteins.

[31799] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2280 gene, herein designated GAM GENE, on one or more GAM2280 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31800] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2280 correlate with, and may be deduced from, the identity of the target genes which GAM2280 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31801] Nucleotide sequences of the GAM2280 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2280 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2280 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2280 are further described hereinbelow with reference to Table 1.

[31802] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2280 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31803] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2281 (GAM2281) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31804] GAM2281 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2281 was detected is described hereinabove with reference to Figs. 2-8.

[31805] GAM2281 gene, herein designated GAM GENE, and GAM2281 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31806] GAM2281 gene, herein designated GAM GENE, encodes a GAM2281 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2281 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2281 precursor RNA is designated SEQ ID:2258, and is provided hereinbelow with reference to the sequence listing part.

[31807] GAM2281 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [31808] An enzyme complex designated DICER COMPLEX, dices the GAM2281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2281 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2281 RNA is designated SEQ ID:4872, and is provided hereinbelow with reference to the sequence listing part.
- [31809] GAM2281 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2281 target RNA, herein designated GAM TARGET RNA. GAM2281 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [31810] GAM2281 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2281 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2281 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2281 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2281 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31811] The complementary binding of GAM2281 RNA, herein designated GAM RNA, to target binding sites on GAM2281 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2281 target RNA, herein designated GAM TARGET RNA, into GAM2281 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31812] It is appreciated that GAM2281 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2281 target genes. The mRNA of each one of this plurality of GAM2281 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2281 RNA, herein designated GAM RNA, and which when bound by GAM2281 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2281 target proteins.

[31813] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2281 gene, herein designated GAM GENE, on one or more GAM2281 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31814] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2281 correlate with, and may be deduced from, the identity of the target genes which GAM2281 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31815] Nucleotide sequences of the GAM2281 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2281 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2281 are further described hereinbelow with reference to Table 1.

[31816] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2281 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[31817] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2282 (GAM2282) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31818] GAM2282 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2282 was detected is described hereinabove with reference to Figs. 2-8.

[31819] GAM2282 gene, herein designated GAM GENE, and GAM2282 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31820] GAM2282 gene, herein designated GAM GENE, encodes a GAM2282 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2282 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2282 precursor RNA is designated SEQ ID:2259, and is provided hereinbelow with reference to the sequence listing part.

[31821] GAM2282 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31822] An enzyme complex designated DICER COMPLEX, dices the GAM2282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2282 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2282 RNA is designated SEQ ID:4873, and is provided hereinbelow with reference to the sequence listing part.

[31823] GAM2282 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2282 target RNA, herein designated GAM TARGET RNA. GAM2282 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31824] GAM2282 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2282 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2282 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2282 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2282 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31825] The complementary binding of GAM2282 RNA, herein designated GAM RNA, to target binding sites on GAM2282 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2282 target RNA, herein designated GAM TARGET RNA, into GAM2282 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31826] It is appreciated that GAM2282 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2282 target genes. The mRNA of each one of this plurality of GAM2282 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2282 RNA, herein designated GAM RNA, and which when bound by GAM2282 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2282 target proteins.

[31827] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2282 gene, herein designated GAM GENE, on one or more GAM2282 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31828] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2282 correlate with, and may be deduced from, the identity of the target genes which GAM2282 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31829] Nucleotide sequences of the GAM2282 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2282 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2282 are further described hereinbelow with reference to Table 1.

[31830] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2282 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31831] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2283 (GAM2283) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31832] GAM2283 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2283 was detected is described hereinabove with reference to Figs. 2-8.

[31833] GAM2283 gene, herein designated GAM GENE, and GAM2283 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31834] GAM2283 gene, herein designated GAM GENE, encodes a GAM2283 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2283 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2283 precursor RNA is designated SEQ ID:2260, and is provided hereinbelow with reference to the sequence listing part.

[31835] GAM2283 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31836] An enzyme complex designated DICER COMPLEX, dices the GAM2283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2283 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2283 RNA is designated SEQ ID:4874, and is provided hereinbelow with reference to the sequence listing part.

[31837] GAM2283 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2283 target RNA, herein designated GAM TARGET RNA. GAM2283 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31838] GAM2283 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2283 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2283 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2283 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2283 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31839] The complementary binding of GAM2283 RNA, herein designated GAM RNA, to target binding sites on GAM2283 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2283 target RNA, herein designated GAM TARGET RNA, into GAM2283 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31840] It is appreciated that GAM2283 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2283 target genes. The

mRNA of each one of this plurality of GAM2283 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2283 RNA, herein designated GAM RNA, and which when bound by GAM2283 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2283 target proteins.

[31841] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2283 gene, herein designated GAM GENE, on one or more GAM2283 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31842] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2283 correlate with, and may be deduced from, the identity of the target genes which GAM2283 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31843] Nucleotide sequences of the GAM2283 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2283 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2283 are further described hereinbelow with reference to Table 1.

[31844] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2283 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31845] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2284 (GAM2284) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31846] GAM2284 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2284 was detected is described hereinabove with reference to Figs. 2-8.

[31847] GAM2284 gene, herein designated GAM GENE, and GAM2284 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31848] GAM2284 gene, herein designated GAM GENE, encodes a GAM2284 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2284 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2284 precursor RNA is designated SEQ ID:2261, and is provided hereinbelow with reference to the sequence listing part.

[31849] GAM2284 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2284 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31850] An enzyme complex designated DICER COMPLEX, dices the GAM2284 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2284 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2284 RNA is designated SEQ ID:4875, and is provided hereinbelow with reference to the sequence listing part.

[31851] GAM2284 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2284 target RNA, herein designated GAM TARGET RNA. GAM2284 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31852] GAM2284 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2284 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2284 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2284 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2284 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31853] The complementary binding of GAM2284 RNA, herein designated GAM RNA, to target binding sites on GAM2284 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2284 target RNA, herein designated GAM TARGET RNA, into GAM2284 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31854] It is appreciated that GAM2284 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2284 target genes. The mRNA of each one of this plurality of GAM2284 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2284 RNA, herein designated GAM RNA, and which when bound by GAM2284 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2284 target proteins.

[31855] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2284 gene, herein designated GAM GENE, on one or more GAM2284 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31856] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2284 correlate with, and may be deduced from, the identity of the target

genes which GAM2284 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31857] Nucleotide sequences of the GAM2284 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2284 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2284 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2284 are further described hereinbelow with reference to Table 1.

[31858] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2284 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31859] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2285 (GAM2285) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31860] GAM2285 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2285 was detected is described hereinabove with reference to Figs. 2-8.

[31861] GAM2285 gene, herein designated GAM GENE, and GAM2285 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[31862] GAM2285 gene, herein designated GAM GENE, encodes a GAM2285 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2285 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2285 precursor RNA is designated SEQ ID:2262, and is provided hereinbelow with reference to the sequence listing part.

[31863] GAM2285 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31864] An enzyme complex designated DICER COMPLEX, dices the GAM2285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2285 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2285 RNA is designated SEQ ID:4876, and is provided

hereinbelow with reference to the sequence listing part.

[31865] GAM2285 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2285 target RNA, herein designated GAM TARGET RNA. GAM2285 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31866] GAM2285 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2285 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2285 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2285 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2285 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31867] The complementary binding of GAM2285 RNA, herein designated GAM RNA, to target binding sites on GAM2285 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2285 target RNA, herein designated GAM TARGET RNA, into GAM2285 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31868] It is appreciated that GAM2285 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2285 target genes. The mRNA of each one of this plurality of GAM2285 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2285 RNA, herein designated GAM RNA, and which when bound by GAM2285 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2285 target proteins.

[31869] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2285 gene, herein designated GAM GENE, on one or more GAM2285 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31870] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2285 correlate with, and may be deduced from, the identity of the target genes which GAM2285 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31871] Nucleotide sequences of the GAM2285 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2285 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2285 are further described hereinbelow with reference to Table 1.

[31872] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2285 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31873] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2286 (GAM2286) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31874] GAM2286 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2286 was detected is described hereinabove with reference to Figs. 2-8.

[31875] GAM2286 gene, herein designated GAM GENE, and GAM2286 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31876] GAM2286 gene, herein designated GAM GENE, encodes a GAM2286 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2286 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2286 precursor RNA is designated SEQ ID:2263, and is provided hereinbelow with reference to the sequence listing part.

[31877] GAM2286 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2286 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31878] An enzyme complex designated DICER COMPLEX, dices the GAM2286 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2286 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2286 RNA is designated SEQ ID:4877, and is provided hereinbelow with reference to the sequence listing part.

[31879] GAM2286 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2286 target RNA, herein designated GAM TARGET RNA. GAM2286 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31880] GAM2286 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2286 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2286 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2286 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2286 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31881] The complementary binding of GAM2286 RNA, herein designated GAM RNA, to target binding sites on GAM2286 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2286 target RNA, herein designated GAM TARGET RNA, into GAM2286 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31882] It is appreciated that GAM2286 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2286 target genes. The mRNA of each one of this plurality of GAM2286 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2286 RNA, herein designated GAM RNA, and which when bound by GAM2286 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2286 target proteins.

[31883] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2286 gene, herein designated GAM GENE, on one or more GAM2286 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31884] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2286 correlate with, and may be deduced from, the identity of the target genes which GAM2286 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31885] Nucleotide sequences of the GAM2286 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2286 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2286 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2286 are further described hereinbelow with reference to Table 1.

[31886] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2286 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31887] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2287 (GAM2287) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31888] GAM2287 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2287 was detected is described hereinabove with reference to Figs. 2-8.

[31889] GAM2287 gene, herein designated GAM GENE, and GAM2287 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31890] GAM2287 gene, herein designated GAM GENE, encodes a GAM2287 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2287 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2287 precursor RNA is designated SEQ ID:2264, and is provided hereinbelow with reference to the sequence listing part.

[31891] GAM2287 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2287 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [31892] An enzyme complex designated DICER COMPLEX, dices the GAM2287 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2287 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2287 RNA is designated SEQ ID:4878, and is provided hereinbelow with reference to the sequence listing part.
- [31893] GAM2287 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2287 target RNA, herein designated GAM TARGET RNA. GAM2287 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [31894] GAM2287 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2287 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2287 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2287 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2287 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31895] The complementary binding of GAM2287 RNA, herein designated GAM RNA, to target binding sites on GAM2287 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2287 target RNA, herein designated GAM TARGET RNA, into GAM2287 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31896] It is appreciated that GAM2287 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2287 target genes. The mRNA of each one of this plurality of GAM2287 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2287 RNA, herein designated GAM RNA, and which when bound by GAM2287 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2287 target proteins.

[31897] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2287 gene, herein designated GAM GENE, on one or more GAM2287 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31898] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2287 correlate with, and may be deduced from, the identity of the target genes which GAM2287 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31899] Nucleotide sequences of the GAM2287 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2287 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2287 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2287 are further described hereinbelow with reference to Table 1.

[31900] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2287 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[31901] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2288 (GAM2288) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31902] GAM2288 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2288 was detected is described hereinabove with reference to Figs. 2-8.

[31903] GAM2288 gene, herein designated GAM GENE, and GAM2288 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31904] GAM2288 gene, herein designated GAM GENE, encodes a GAM2288 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2288 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2288 precursor RNA is designated SEQ ID:2265, and is provided hereinbelow with reference to the sequence listing part.

[31905] GAM2288 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31906] An enzyme complex designated DICER COMPLEX, dices the GAM2288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2288 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2288 RNA is designated SEQ ID:4879, and is provided hereinbelow with reference to the sequence listing part.

[31907] GAM2288 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2288 target RNA, herein designated GAM TARGET RNA. GAM2288 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31908] GAM2288 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2288 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2288 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2288 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2288 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31909] The complementary binding of GAM2288 RNA, herein designated GAM RNA, to target binding sites on GAM2288 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2288 target RNA, herein designated GAM TARGET RNA, into GAM2288 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31910] It is appreciated that GAM2288 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2288 target genes. The mRNA of each one of this plurality of GAM2288 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2288 RNA, herein designated GAM RNA, and which when bound by GAM2288 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2288 target proteins.

[31911] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2288 gene, herein designated GAM GENE, on one or more GAM2288 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31912] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2288 correlate with, and may be deduced from, the identity of the target genes which GAM2288 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31913] Nucleotide sequences of the GAM2288 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2288 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2288 are further described hereinbelow with reference to Table 1.

[31914] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2288 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31915] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2289 (GAM2289) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31916] GAM2289 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2289 was detected is described hereinabove with reference to Figs. 2-8.

[31917] GAM2289 gene, herein designated GAM GENE, and GAM2289 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31918] GAM2289 gene, herein designated GAM GENE, encodes a GAM2289 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2289 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2289 precursor RNA is designated SEQ ID:2266, and is provided hereinbelow with reference to the sequence listing part.

[31919] GAM2289 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31920] An enzyme complex designated DICER COMPLEX, dices the GAM2289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2289 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2289 RNA is designated SEQ ID:4880, and is provided hereinbelow with reference to the sequence listing part.

[31921] GAM2289 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2289 target RNA, herein designated GAM TARGET RNA. GAM2289 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31922] GAM2289 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2289 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2289 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2289 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2289 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31923] The complementary binding of GAM2289 RNA, herein designated GAM RNA, to target binding sites on GAM2289 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2289 target RNA, herein designated GAM TARGET RNA, into GAM2289 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31924] It is appreciated that GAM2289 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2289 target genes. The

mRNA of each one of this plurality of GAM2289 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2289 RNA, herein designated GAM RNA, and which when bound by GAM2289 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2289 target proteins.

[31925] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2289 gene, herein designated GAM GENE, on one or more GAM2289 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31926] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2289 correlate with, and may be deduced from, the identity of the target genes which GAM2289 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31927] Nucleotide sequences of the GAM2289 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2289 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2289 are further described hereinbelow with reference to Table 1.

[31928] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2289 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31929] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2290 (GAM2290) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31930] GAM2290 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2290 was detected is described hereinabove with reference to Figs. 2-8.

[31931] GAM2290 gene, herein designated GAM GENE, and GAM2290 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31932] GAM2290 gene, herein designated GAM GENE, encodes a GAM2290 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2290 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2290 precursor RNA is designated SEQ ID:2267, and is provided hereinbelow with reference to the sequence listing part.

[31933] GAM2290 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31934] An enzyme complex designated DICER COMPLEX, dices the GAM2290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2290 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2290 RNA is designated SEQ ID:4881, and is provided hereinbelow with reference to the sequence listing part.

[31935] GAM2290 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2290 target RNA, herein designated GAM TARGET RNA. GAM2290 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31936] GAM2290 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2290 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2290 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2290 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2290 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31937] The complementary binding of GAM2290 RNA, herein designated GAM RNA, to target binding sites on GAM2290 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2290 target RNA, herein designated GAM TARGET RNA, into GAM2290 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31938] It is appreciated that GAM2290 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2290 target genes. The mRNA of each one of this plurality of GAM2290 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2290 RNA, herein designated GAM RNA, and which when bound by GAM2290 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2290 target proteins.

[31939] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2290 gene, herein designated GAM GENE, on one or more GAM2290 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31940] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2290 correlate with, and may be deduced from, the identity of the target

genes which GAM2290 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31941] Nucleotide sequences of the GAM2290 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2290 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2290 are further described hereinbelow with reference to Table 1.

[31942] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2290 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31943] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2291 (GAM2291) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31944] GAM2291 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2291 was detected is described hereinabove with reference to Figs. 2-8.

[31945] GAM2291 gene, herein designated GAM GENE, and GAM2291 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[31946] GAM2291 gene, herein designated GAM GENE, encodes a GAM2291 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2291 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2291 precursor RNA is designated SEQ ID:2268, and is provided hereinbelow with reference to the sequence listing part.

[31947] GAM2291 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31948] An enzyme complex designated DICER COMPLEX, dices the GAM2291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2291 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2291 RNA is designated SEQ ID:4882, and is provided

hereinbelow with reference to the sequence listing part.

[31949] GAM2291 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2291 target RNA, herein designated GAM TARGET RNA. GAM2291 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31950] GAM2291 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2291 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2291 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2291 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2291 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31951] The complementary binding of GAM2291 RNA, herein designated GAM RNA, to target binding sites on GAM2291 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2291 target RNA, herein designated GAM TARGET RNA, into GAM2291 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31952] It is appreciated that GAM2291 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2291 target genes. The mRNA of each one of this plurality of GAM2291 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2291 RNA, herein designated GAM RNA, and which when bound by GAM2291 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2291 target proteins.

[31953] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2291 gene, herein designated GAM GENE, on one or more GAM2291 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31954] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2291 correlate with, and may be deduced from, the identity of the target genes which GAM2291 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31955] Nucleotide sequences of the GAM2291 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2291 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2291 are further described hereinbelow with reference to Table 1.

[31956] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2291 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31957] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2292 (GAM2292) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31958] GAM2292 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2292 was detected is described hereinabove with reference to Figs. 2-8.

[31959] GAM2292 gene, herein designated GAM GENE, and GAM2292 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31960] GAM2292 gene, herein designated GAM GENE, encodes a GAM2292 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2292 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2292 precursor RNA is designated SEQ ID:2269, and is provided hereinbelow with reference to the sequence listing part.

[31961] GAM2292 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31962] An enzyme complex designated DICER COMPLEX, dices the GAM2292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2292 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2292 RNA is designated SEQ ID:4883, and is provided hereinbelow with reference to the sequence listing part.

[31963] GAM2292 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2292 target RNA, herein designated GAM TARGET RNA. GAM2292 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31964] GAM2292 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2292 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2292 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2292 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2292 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31965] The complementary binding of GAM2292 RNA, herein designated GAM RNA, to target binding sites on GAM2292 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2292 target RNA, herein designated GAM TARGET RNA, into GAM2292 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31966] It is appreciated that GAM2292 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2292 target genes. The mRNA of each one of this plurality of GAM2292 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2292 RNA, herein designated GAM RNA, and which when bound by GAM2292 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2292 target proteins.

[31967] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2292 gene, herein designated GAM GENE, on one or more GAM2292 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31968] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2292 correlate with, and may be deduced from, the identity of the target genes which GAM2292 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31969] Nucleotide sequences of the GAM2292 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2292 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2292 are further described hereinbelow with reference to Table 1.

[31970] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2292 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31971] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2293 (GAM2293) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[31972] GAM2293 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2293 was detected is described hereinabove with reference to Figs. 2-8.

[31973] GAM2293 gene, herein designated GAM GENE, and GAM2293 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[31974] GAM2293 gene, herein designated GAM GENE, encodes a GAM2293 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2293 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2293 precursor RNA is designated SEQ ID:2270, and is provided hereinbelow with reference to the sequence listing part.

[31975] GAM2293 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [31976] An enzyme complex designated DICER COMPLEX, dices the GAM2293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2293 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2293 RNA is designated SEQ ID:4884, and is provided hereinbelow with reference to the sequence listing part.
- [31977] GAM2293 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2293 target RNA, herein designated GAM TARGET RNA. GAM2293 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [31978] GAM2293 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2293 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2293 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2293 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2293 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31979] The complementary binding of GAM2293 RNA, herein designated GAM RNA, to target binding sites on GAM2293 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2293 target RNA, herein designated GAM TARGET RNA, into GAM2293 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31980] It is appreciated that GAM2293 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2293 target genes. The mRNA of each one of this plurality of GAM2293 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2293 RNA, herein designated GAM RNA, and which when bound by GAM2293 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2293 target proteins.

[31981] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2293 gene, herein designated GAM GENE, on one or more GAM2293 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31982] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2293 correlate with, and may be deduced from, the identity of the target genes which GAM2293 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31983] Nucleotide sequences of the GAM2293 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2293 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2293 are further described hereinbelow with reference to Table 1.

[31984] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2293 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [31985] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2294 (GAM2294) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [31986] GAM2294 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2294 was detected is described hereinabove with reference to Figs. 2-8.
- [31987] GAM2294 gene, herein designated GAM GENE, and GAM2294 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [31988] GAM2294 gene, herein designated GAM GENE, encodes a GAM2294 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2294 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2294 precursor RNA is designated SEQ ID:2271, and is provided hereinbelow with reference to the sequence listing part.
- [31989] GAM2294 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31990] An enzyme complex designated DICER COMPLEX, dices the GAM2294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2294 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2294 RNA is designated SEQ ID:4885, and is provided hereinbelow with reference to the sequence listing part.

[31991] GAM2294 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2294 target RNA, herein designated GAM TARGET RNA. GAM2294 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31992] GAM2294 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2294 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2294 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2294 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2294 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31993] The complementary binding of GAM2294 RNA, herein designated GAM RNA, to target binding sites on GAM2294 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2294 target RNA, herein designated GAM TARGET RNA, into GAM2294 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[31994] It is appreciated that GAM2294 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2294 target genes. The mRNA of each one of this plurality of GAM2294 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2294 RNA, herein designated GAM RNA, and which when bound by GAM2294 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2294 target proteins.

[31995] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2294 gene, herein designated GAM GENE, on one or more GAM2294 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31996] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2294 correlate with, and may be deduced from, the identity of the target genes which GAM2294 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31997] Nucleotide sequences of the GAM2294 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2294 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2294 are further described hereinbelow with reference to Table 1.

[31998] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2294 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[31999] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2295 (GAM2295) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32000] GAM2295 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2295 was detected is described hereinabove with reference to Figs. 2-8.

[32001] GAM2295 gene, herein designated GAM GENE, and GAM2295 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32002] GAM2295 gene, herein designated GAM GENE, encodes a GAM2295 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2295 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2295 precursor RNA is designated SEQ ID:2272, and is provided hereinbelow with reference to the sequence listing part.

[32003] GAM2295 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2295 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32004] An enzyme complex designated DICER COMPLEX, dices the GAM2295 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2295 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2295 RNA is designated SEQ ID:4886, and is provided hereinbelow with reference to the sequence listing part.

[32005] GAM2295 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2295 target RNA, herein designated GAM TARGET RNA. GAM2295 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32006] GAM2295 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2295 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2295 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2295 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2295 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32007] The complementary binding of GAM2295 RNA, herein designated GAM RNA, to target binding sites on GAM2295 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2295 target RNA, herein designated GAM TARGET RNA, into GAM2295 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32008] It is appreciated that GAM2295 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2295 target genes. The

mRNA of each one of this plurality of GAM2295 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2295 RNA, herein designated GAM RNA, and which when bound by GAM2295 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2295 target proteins.

[32009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2295 gene, herein designated GAM GENE, on one or more GAM2295 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32010] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2295 correlate with, and may be deduced from, the identity of the target genes which GAM2295 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32011] Nucleotide sequences of the GAM2295 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2295 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2295 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2295 are further described hereinbelow with reference to Table 1.

[32012] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2295 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32013] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2296 (GAM2296) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32014] GAM2296 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2296 was detected is described hereinabove with reference to Figs. 2-8.

[32015] GAM2296 gene, herein designated GAM GENE, and GAM2296 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32016] GAM2296 gene, herein designated GAM GENE, encodes a GAM2296 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2296 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2296 precursor RNA is designated SEQ ID:2273, and is provided hereinbelow with reference to the sequence listing part.

[32017] GAM2296 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32018] An enzyme complex designated DICER COMPLEX, dices the GAM2296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2296 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2296 RNA is designated SEQ ID:4887, and is provided hereinbelow with reference to the sequence listing part.

[32019] GAM2296 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2296 target RNA, herein designated GAM TARGET RNA. GAM2296 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32020] GAM2296 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2296 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2296 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2296 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2296 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32021] The complementary binding of GAM2296 RNA, herein designated GAM RNA, to target binding sites on GAM2296 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2296 target RNA, herein designated GAM TARGET RNA, into GAM2296 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32022] It is appreciated that GAM2296 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2296 target genes. The mRNA of each one of this plurality of GAM2296 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2296 RNA, herein designated GAM RNA, and which when bound by GAM2296 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2296 target proteins.

[32023] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2296 gene, herein designated GAM GENE, on one or more GAM2296 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32024] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2296 correlate with, and may be deduced from, the identity of the target

genes which GAM2296 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32025] Nucleotide sequences of the GAM2296 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2296 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2296 are further described hereinbelow with reference to Table 1.

[32026] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2296 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32027] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2297 (GAM2297) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32028] GAM2297 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2297 was detected is described hereinabove with reference to Figs. 2-8.

[32029] GAM2297 gene, herein designated GAM GENE, and GAM2297 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[32030] GAM2297 gene, herein designated GAM GENE, encodes a GAM2297 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2297 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2297 precursor RNA is designated SEQ ID:2274, and is provided hereinbelow with reference to the sequence listing part.

[32031] GAM2297 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32032] An enzyme complex designated DICER COMPLEX, dices the GAM2297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2297 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2297 RNA is designated SEQ ID:4888, and is provided

hereinbelow with reference to the sequence listing part.

[32033] GAM2297 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2297 target RNA, herein designated GAM TARGET RNA. GAM2297 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32034] GAM2297 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2297 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2297 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2297 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2297 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32035] The complementary binding of GAM2297 RNA, herein designated GAM RNA, to target binding sites on GAM2297 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2297 target RNA, herein designated GAM TARGET RNA, into GAM2297 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32036] It is appreciated that GAM2297 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2297 target genes. The mRNA of each one of this plurality of GAM2297 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2297 RNA, herein designated GAM RNA, and which when bound by GAM2297 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2297 target proteins.

[32037] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2297 gene, herein designated GAM GENE, on one or more GAM2297 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32038] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2297 correlate with, and may be deduced from, the identity of the target genes which GAM2297 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32039] Nucleotide sequences of the GAM2297 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2297 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2297 are further described hereinbelow with reference to Table 1.

[32040] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2297 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32041] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2298 (GAM2298) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32042] GAM2298 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2298 was detected is described hereinabove with reference to Figs. 2-8.

[32043] GAM2298 gene, herein designated GAM GENE, and GAM2298 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32044] GAM2298 gene, herein designated GAM GENE, encodes a GAM2298 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2298 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2298 precursor RNA is designated SEQ ID:2275, and is provided hereinbelow with reference to the sequence listing part.

[32045] GAM2298 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32046] An enzyme complex designated DICER COMPLEX, dices the GAM2298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2298 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2298 RNA is designated SEQ ID:4889, and is provided hereinbelow with reference to the sequence listing part.

[32047] GAM2298 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2298 target RNA, herein designated GAM TARGET RNA. GAM2298 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32048] GAM2298 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2298 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2298 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2298 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2298 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32049] The complementary binding of GAM2298 RNA, herein designated GAM RNA, to target binding sites on GAM2298 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2298 target RNA, herein designated GAM TARGET RNA, into GAM2298 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32050] It is appreciated that GAM2298 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2298 target genes. The mRNA of each one of this plurality of GAM2298 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2298 RNA, herein designated GAM RNA, and which when bound by GAM2298 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2298 target proteins.

[32051] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2298 gene, herein designated GAM GENE, on one or more GAM2298 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32052] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2298 correlate with, and may be deduced from, the identity of the target genes which GAM2298 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32053] Nucleotide sequences of the GAM2298 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2298 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2298 are further described hereinbelow with reference to Table 1.

[32054] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2298 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32055] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2299 (GAM2299) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32056] GAM2299 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2299 was detected is described hereinabove with reference to Figs. 2-8.

[32057] GAM2299 gene, herein designated GAM GENE, and GAM2299 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32058] GAM2299 gene, herein designated GAM GENE, encodes a GAM2299 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2299 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2299 precursor RNA is designated SEQ ID:2276, and is provided hereinbelow with reference to the sequence listing part.

[32059] GAM2299 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32060] An enzyme complex designated DICER COMPLEX, dices the GAM2299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2299 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2299 RNA is designated SEQ ID:4890, and is provided hereinbelow with reference to the sequence listing part.

[32061] GAM2299 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2299 target RNA, herein designated GAM TARGET RNA. GAM2299 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32062] GAM2299 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2299 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2299 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2299 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2299 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32063] The complementary binding of GAM2299 RNA, herein designated GAM RNA, to target binding sites on GAM2299 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2299 target RNA, herein designated GAM TARGET RNA, into GAM2299 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32064] It is appreciated that GAM2299 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2299 target genes. The mRNA of each one of this plurality of GAM2299 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2299 RNA, herein designated GAM RNA, and which when bound by GAM2299 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2299 target proteins.

[32065] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2299 gene, herein designated GAM GENE, on one or more GAM2299 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32066] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2299 correlate with, and may be deduced from, the identity of the target genes which GAM2299 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32067] Nucleotide sequences of the GAM2299 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2299 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2299 are further described hereinbelow with reference to Table 1.

[32068] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2299 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[32069] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2300 (GAM2300) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32070] GAM2300 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2300 was detected is described hereinabove with reference to Figs. 2-8.

[32071] GAM2300 gene, herein designated GAM GENE, and GAM2300 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32072] GAM2300 gene, herein designated GAM GENE, encodes a GAM2300 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2300 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2300 precursor RNA is designated SEQ ID:2277, and is provided hereinbelow with reference to the sequence listing part.

[32073] GAM2300 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32074] An enzyme complex designated DICER COMPLEX, dices the GAM2300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2300 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2300 RNA is designated SEQ ID:4891, and is provided hereinbelow with reference to the sequence listing part.

[32075] GAM2300 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2300 target RNA, herein designated GAM TARGET RNA. GAM2300 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32076] GAM2300 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2300 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2300 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2300 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2300 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32077] The complementary binding of GAM2300 RNA, herein designated GAM RNA, to target binding sites on GAM2300 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2300 target RNA, herein designated GAM TARGET RNA, into GAM2300 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32078] It is appreciated that GAM2300 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2300 target genes. The mRNA of each one of this plurality of GAM2300 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2300 RNA, herein designated GAM RNA, and which when bound by GAM2300 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2300 target proteins.

[32079] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2300 gene, herein designated GAM GENE, on one or more GAM2300 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32080] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2300 correlate with, and may be deduced from, the identity of the target genes which GAM2300 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32081] Nucleotide sequences of the GAM2300 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2300 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2300 are further described hereinbelow with reference to Table 1.

[32082] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2300 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32083] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2301 (GAM2301) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32084] GAM2301 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2301 was detected is described hereinabove with reference to Figs. 2-8.

[32085] GAM2301 gene, herein designated GAM GENE, and GAM2301 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32086] GAM2301 gene, herein designated GAM GENE, encodes a GAM2301 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2301 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2301 precursor RNA is designated SEQ ID:2278, and is provided hereinbelow with reference to the sequence listing part.

[32087] GAM2301 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2301 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32088] An enzyme complex designated DICER COMPLEX, dices the GAM2301 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2301 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM2301 RNA is designated SEQ ID:4893, and is provided hereinbelow with reference to the sequence listing part.

[32089] GAM2301 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2301 target RNA, herein designated GAM TARGET RNA. GAM2301 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32090] GAM2301 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2301 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2301 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2301 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2301 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32091] The complementary binding of GAM2301 RNA, herein designated GAM RNA, to target binding sites on GAM2301 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2301 target RNA, herein designated GAM TARGET RNA, into GAM2301 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32092] It is appreciated that GAM2301 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2301 target genes. The

mRNA of each one of this plurality of GAM2301 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2301 RNA, herein designated GAM RNA, and which when bound by GAM2301 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2301 target proteins.

[32093] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2301 gene, herein designated GAM GENE, on one or more GAM2301 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32094] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2301 correlate with, and may be deduced from, the identity of the target genes which GAM2301 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32095] Nucleotide sequences of the GAM2301 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2301 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2301 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2301 are further described hereinbelow with reference to Table 1.

[32096] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2301 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32097] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2302 (GAM2302) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32098] GAM2302 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2302 was detected is described hereinabove with reference to Figs. 2-8.

[32099] GAM2302 gene, herein designated GAM GENE, and GAM2302 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32100] GAM2302 gene, herein designated GAM GENE, encodes a GAM2302 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2302 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2302 precursor RNA is designated SEQ ID:2279, and is provided hereinbelow with reference to the sequence listing part.

[32101] GAM2302 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32102] An enzyme complex designated DICER COMPLEX, dices the GAM2302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2302 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2302 RNA is designated SEQ ID:4892, and is provided hereinbelow with reference to the sequence listing part.

[32103] GAM2302 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2302 target RNA, herein designated GAM TARGET RNA. GAM2302 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32104] GAM2302 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2302 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2302 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2302 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2302 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32105] The complementary binding of GAM2302 RNA, herein designated GAM RNA, to target binding sites on GAM2302 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2302 target RNA, herein designated GAM TARGET RNA, into GAM2302 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32106] It is appreciated that GAM2302 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2302 target genes. The mRNA of each one of this plurality of GAM2302 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2302 RNA, herein designated GAM RNA, and which when bound by GAM2302 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2302 target proteins.

[32107] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2302 gene, herein designated GAM GENE, on one or more GAM2302 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32108] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2302 correlate with, and may be deduced from, the identity of the target

genes which GAM2302 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32109] Nucleotide sequences of the GAM2302 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2302 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2302 are further described hereinbelow with reference to Table 1.

[32110] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2302 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32111] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2303 (GAM2303) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32112] GAM2303 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2303 was detected is described hereinabove with reference to Figs. 2-8.

[32113] GAM2303 gene, herein designated GAM GENE, and GAM2303 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

- [32114] GAM2303 gene, herein designated GAM GENE, encodes a GAM2303 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2303 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2303 precursor RNA is designated SEQ ID:2280, and is provided hereinbelow with reference to the sequence listing part.
- [32115] GAM2303 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [32116] An enzyme complex designated DICER COMPLEX, dices the GAM2303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2303 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2303 RNA is designated SEQ ID:4894, and is provided

hereinbelow with reference to the sequence listing part.

[32117] GAM2303 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2303 target RNA, herein designated GAM TARGET RNA. GAM2303 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32118] GAM2303 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2303 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2303 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2303 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2303 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32119] The complementary binding of GAM2303 RNA, herein designated GAM RNA, to target binding sites on GAM2303 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2303 target RNA, herein designated GAM TARGET RNA, into GAM2303 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32120] It is appreciated that GAM2303 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2303 target genes. The mRNA of each one of this plurality of GAM2303 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2303 RNA, herein designated GAM RNA, and which when bound by GAM2303 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2303 target proteins.

[32121] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2303 gene, herein designated GAM GENE, on one or more GAM2303 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32122] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2303 correlate with, and may be deduced from, the identity of the target genes which GAM2303 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32123] Nucleotide sequences of the GAM2303 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2303 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2303 are further described hereinbelow with reference to Table 1.

[32124] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2303 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32125] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2304 (GAM2304) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32126] GAM2304 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2304 was detected is described hereinabove with reference to Figs. 2-8.

[32127] GAM2304 gene, herein designated GAM GENE, and GAM2304 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32128] GAM2304 gene, herein designated GAM GENE, encodes a GAM2304 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2304 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2304 precursor RNA is designated SEQ ID:2281, and is provided hereinbelow with reference to the sequence listing part.

[32129] GAM2304 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32130] An enzyme complex designated DICER COMPLEX, dices the GAM2304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2304 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2304 RNA is designated SEQ ID:4895, and is provided hereinbelow with reference to the sequence listing part.

[32131] GAM2304 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2304 target RNA, herein designated GAM TARGET RNA. GAM2304 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32132] GAM2304 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2304 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2304 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2304 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2304 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32133] The complementary binding of GAM2304 RNA, herein designated GAM RNA, to target binding sites on GAM2304 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2304 target RNA, herein designated GAM TARGET RNA, into GAM2304 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32134] It is appreciated that GAM2304 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2304 target genes. The mRNA of each one of this plurality of GAM2304 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2304 RNA, herein designated GAM RNA, and which when bound by GAM2304 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2304 target proteins.

[32135] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2304 gene, herein designated GAM GENE, on one or more GAM2304 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32136] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2304 correlate with, and may be deduced from, the identity of the target genes which GAM2304 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32137] Nucleotide sequences of the GAM2304 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2304 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2304 are further described hereinbelow with reference to Table 1.

[32138] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2304 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32139] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2305 (GAM2305) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32140] GAM2305 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2305 was detected is described hereinabove with reference to Figs. 2-8.

[32141] GAM2305 gene, herein designated GAM GENE, and GAM2305 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32142] GAM2305 gene, herein designated GAM GENE, encodes a GAM2305 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2305 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2305 precursor RNA is designated SEQ ID:2282, and is provided hereinbelow with reference to the sequence listing part.

[32143] GAM2305 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2305 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [32144] An enzyme complex designated DICER COMPLEX, dices the GAM2305 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2305 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2305 RNA is designated SEQ ID:4896, and is provided hereinbelow with reference to the sequence listing part.
- [32145] GAM2305 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2305 target RNA, herein designated GAM TARGET RNA. GAM2305 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [32146] GAM2305 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2305 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2305 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2305 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2305 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32147] The complementary binding of GAM2305 RNA, herein designated GAM RNA, to target binding sites on GAM2305 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2305 target RNA, herein designated GAM TARGET RNA, into GAM2305 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32148] It is appreciated that GAM2305 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2305 target genes. The mRNA of each one of this plurality of GAM2305 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2305 RNA, herein designated GAM RNA, and which when bound by GAM2305 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2305 target proteins.

[32149] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2305 gene, herein designated GAM GENE, on one or more GAM2305 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32150] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2305 correlate with, and may be deduced from, the identity of the target genes which GAM2305 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32151] Nucleotide sequences of the GAM2305 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2305 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2305 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2305 are further described hereinbelow with reference to Table 1.

[32152] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2305 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [32153] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2306 (GAM2306) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [32154] GAM2306 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2306 was detected is described hereinabove with reference to Figs. 2-8.
- [32155] GAM2306 gene, herein designated GAM GENE, and GAM2306 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [32156] GAM2306 gene, herein designated GAM GENE, encodes a GAM2306 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2306 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2306 precursor RNA is designated SEQ ID:2283, and is provided hereinbelow with reference to the sequence listing part.
- [32157] GAM2306 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32158] An enzyme complex designated DICER COMPLEX, dices the GAM2306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2306 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2306 RNA is designated SEQ ID:4897, and is provided hereinbelow with reference to the sequence listing part.

[32159] GAM2306 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2306 target RNA, herein designated GAM TARGET RNA. GAM2306 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32160] GAM2306 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2306 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2306 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2306 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2306 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32161] The complementary binding of GAM2306 RNA, herein designated GAM RNA, to target binding sites on GAM2306 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2306 target RNA, herein designated GAM TARGET RNA, into GAM2306 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32162] It is appreciated that GAM2306 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2306 target genes. The mRNA of each one of this plurality of GAM2306 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2306 RNA, herein designated GAM RNA, and which when bound by GAM2306 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2306 target proteins.

[32163] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2306 gene, herein designated GAM GENE, on one or more GAM2306 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32164] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2306 correlate with, and may be deduced from, the identity of the target genes which GAM2306 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32165] Nucleotide sequences of the GAM2306 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2306 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2306 are further described hereinbelow with reference to Table 1.

[32166] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2306 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32167] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2307 (GAM2307) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32168] GAM2307 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2307 was detected is described hereinabove with reference to Figs. 2-8.

[32169] GAM2307 gene, herein designated GAM GENE, and GAM2307 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32170] GAM2307 gene, herein designated GAM GENE, encodes a GAM2307 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2307 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2307 precursor RNA is designated SEQ ID:2284, and is provided hereinbelow with reference to the sequence listing part.

[32171] GAM2307 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2307 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32172] An enzyme complex designated DICER COMPLEX, dices the GAM2307 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2307 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2307 RNA is designated SEQ ID:4898, and is provided hereinbelow with reference to the sequence listing part.

[32173] GAM2307 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2307 target RNA, herein designated GAM TARGET RNA. GAM2307 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32174] GAM2307 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2307 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2307 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2307 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2307 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32175] The complementary binding of GAM2307 RNA, herein designated GAM RNA, to target binding sites on GAM2307 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2307 target RNA, herein designated GAM TARGET RNA, into GAM2307 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32176] It is appreciated that GAM2307 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2307 target genes. The

mRNA of each one of this plurality of GAM2307 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2307 RNA, herein designated GAM RNA, and which when bound by GAM2307 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2307 target proteins.

[32177] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2307 gene, herein designated GAM GENE, on one or more GAM2307 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32178] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2307 correlate with, and may be deduced from, the identity of the target genes which GAM2307 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32179] Nucleotide sequences of the GAM2307 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2307 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2307 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2307 are further described hereinbelow with reference to Table 1.

[32180] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2307 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32181] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2308 (GAM2308) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32182] GAM2308 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2308 was detected is described hereinabove with reference to Figs. 2-8.

[32183] GAM2308 gene, herein designated GAM GENE, and GAM2308 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32184] GAM2308 gene, herein designated GAM GENE, encodes a GAM2308 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2308 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2308 precursor RNA is designated SEQ ID:2285, and is provided hereinbelow with reference to the sequence listing part.

[32185] GAM2308 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2308 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32186] An enzyme complex designated DICER COMPLEX, dices the GAM2308 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2308 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2308 RNA is designated SEQ ID:4899, and is provided hereinbelow with reference to the sequence listing part.

[32187] GAM2308 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2308 target RNA, herein designated GAM TARGET RNA. GAM2308 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32188] GAM2308 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2308 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2308 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2308 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2308 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32189] The complementary binding of GAM2308 RNA, herein designated GAM RNA, to target binding sites on GAM2308 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2308 target RNA, herein designated GAM TARGET RNA, into GAM2308 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32190] It is appreciated that GAM2308 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2308 target genes. The mRNA of each one of this plurality of GAM2308 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2308 RNA, herein designated GAM RNA, and which when bound by GAM2308 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2308 target proteins.

[32191] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2308 gene, herein designated GAM GENE, on one or more GAM2308 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32192] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2308 correlate with, and may be deduced from, the identity of the target

genes which GAM2308 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32193] Nucleotide sequences of the GAM2308 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2308 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2308 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2308 are further described hereinbelow with reference to Table 1.

[32194] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2308 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32195] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2309 (GAM2309) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32196] GAM2309 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2309 was detected is described hereinabove with reference to Figs. 2-8.

[32197] GAM2309 gene, herein designated GAM GENE, and GAM2309 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[32198] GAM2309 gene, herein designated GAM GENE, encodes a GAM2309 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2309 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2309 precursor RNA is designated SEQ ID:2286, and is provided hereinbelow with reference to the sequence listing part.

[32199] GAM2309 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32200] An enzyme complex designated DICER COMPLEX, dices the GAM2309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2309 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2309 RNA is designated SEQ ID:4900, and is provided

hereinbelow with reference to the sequence listing part.

[32201] GAM2309 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2309 target RNA, herein designated GAM TARGET RNA. GAM2309 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32202] GAM2309 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2309 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2309 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2309 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2309 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32203] The complementary binding of GAM2309 RNA, herein designated GAM RNA, to target binding sites on GAM2309 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2309 target RNA, herein designated GAM TARGET RNA, into GAM2309 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32204] It is appreciated that GAM2309 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2309 target genes. The mRNA of each one of this plurality of GAM2309 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2309 RNA, herein designated GAM RNA, and which when bound by GAM2309 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2309 target proteins.

[32205] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2309 gene, herein designated GAM GENE, on one or more GAM2309 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32206] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2309 correlate with, and may be deduced from, the identity of the target genes which GAM2309 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32207] Nucleotide sequences of the GAM2309 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2309 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2309 are further described hereinbelow with reference to Table 1.

[32208] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2309 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32209] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2310 (GAM2310) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32210] GAM2310 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2310 was detected is described hereinabove with reference to Figs. 2-8.

[32211] GAM2310 gene, herein designated GAM GENE, and GAM2310 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32212] GAM2310 gene, herein designated GAM GENE, encodes a GAM2310 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2310 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2310 precursor RNA is designated SEQ ID:2287, and is provided hereinbelow with reference to the sequence listing part.

[32213] GAM2310 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32214] An enzyme complex designated DICER COMPLEX, dices the GAM2310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2310 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2310 RNA is designated SEQ ID:4901, and is provided hereinbelow with reference to the sequence listing part.

[32215] GAM2310 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2310 target RNA, herein designated GAM TARGET RNA. GAM2310 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32216] GAM2310 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2310 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2310 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2310 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2310 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32217] The complementary binding of GAM2310 RNA, herein designated GAM RNA, to target binding sites on GAM2310 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2310 target RNA, herein designated GAM TARGET RNA, into GAM2310 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32218] It is appreciated that GAM2310 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2310 target genes. The mRNA of each one of this plurality of GAM2310 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2310 RNA, herein designated GAM RNA, and which when bound by GAM2310 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2310 target proteins.

[32219] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2310 gene, herein designated GAM GENE, on one or more GAM2310 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32220] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2310 correlate with, and may be deduced from, the identity of the target genes which GAM2310 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32221] Nucleotide sequences of the GAM2310 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2310 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2310 are further described hereinbelow with reference to Table 1.

[32222] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2310 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32223] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2311 (GAM2311) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32224] GAM2311 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2311 was detected is described hereinabove with reference to Figs. 2-8.

[32225] GAM2311 gene, herein designated GAM GENE, and GAM2311 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32226] GAM2311 gene, herein designated GAM GENE, encodes a GAM2311 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2311 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2311 precursor RNA is designated SEQ ID:2288, and is provided hereinbelow with reference to the sequence listing part.

[32227] GAM2311 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [32228] An enzyme complex designated DICER COMPLEX, dices the GAM2311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2311 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM2311 RNA is designated SEQ ID:4902, and is provided hereinbelow with reference to the sequence listing part.
- [32229] GAM2311 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2311 target RNA, herein designated GAM TARGET RNA. GAM2311 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [32230] GAM2311 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2311 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2311 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2311 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2311 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32231] The complementary binding of GAM2311 RNA, herein designated GAM RNA, to target binding sites on GAM2311 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2311 target RNA, herein designated GAM TARGET RNA, into GAM2311 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32232] It is appreciated that GAM2311 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2311 target genes. The mRNA of each one of this plurality of GAM2311 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2311 RNA, herein designated GAM RNA, and which when bound by GAM2311 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2311 target proteins.

[32233] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2311 gene, herein designated GAM GENE, on one or more GAM2311 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32234] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2311 correlate with, and may be deduced from, the identity of the target genes which GAM2311 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32235] Nucleotide sequences of the GAM2311 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2311 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2311 are further described hereinbelow with reference to Table 1.

[32236] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2311 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[32237] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2312 (GAM2312) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32238] GAM2312 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2312 was detected is described hereinabove with reference to Figs. 2-8.

[32239] GAM2312 gene, herein designated GAM GENE, and GAM2312 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32240] GAM2312 gene, herein designated GAM GENE, encodes a GAM2312 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2312 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2312 precursor RNA is designated SEQ ID:2289, and is provided hereinbelow with reference to the sequence listing part.

[32241] GAM2312 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2312 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32242] An enzyme complex designated DICER COMPLEX, dices the GAM2312 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2312 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM2312 RNA is designated SEQ ID:4903, and is provided hereinbelow with reference to the sequence listing part.

[32243] GAM2312 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2312 target RNA, herein designated GAM TARGET RNA. GAM2312 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32244] GAM2312 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2312 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2312 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2312 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2312 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32245] The complementary binding of GAM2312 RNA, herein designated GAM RNA, to target binding sites on GAM2312 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2312 target RNA, herein designated GAM TARGET RNA, into GAM2312 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32246] It is appreciated that GAM2312 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2312 target genes. The mRNA of each one of this plurality of GAM2312 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2312 RNA, herein designated GAM RNA, and which when bound by GAM2312 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2312 target proteins.

[32247] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2312 gene, herein designated GAM GENE, on one or more GAM2312 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32248] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2312 correlate with, and may be deduced from, the identity of the target genes which GAM2312 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32249] Nucleotide sequences of the GAM2312 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2312 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2312 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2312 are further described hereinbelow with reference to Table 1.

[32250] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2312 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32251] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2313 (GAM2313) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32252] GAM2313 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2313 was detected is described hereinabove with reference to Figs. 2-8.

[32253] GAM2313 gene, herein designated GAM GENE, and GAM2313 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32254] GAM2313 gene, herein designated GAM GENE, encodes a GAM2313 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2313 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2313 precursor RNA is designated SEQ ID:2290, and is provided hereinbelow with reference to the sequence listing part.

[32255] GAM2313 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32256] An enzyme complex designated DICER COMPLEX, dices the GAM2313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2313 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2313 RNA is designated SEQ ID:4904, and is provided hereinbelow with reference to the sequence listing part.

[32257] GAM2313 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2313 target RNA, herein designated GAM TARGET RNA. GAM2313 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32258] GAM2313 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2313 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2313 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2313 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2313 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32259] The complementary binding of GAM2313 RNA, herein designated GAM RNA, to target binding sites on GAM2313 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2313 target RNA, herein designated GAM TARGET RNA, into GAM2313 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32260] It is appreciated that GAM2313 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2313 target genes. The

mRNA of each one of this plurality of GAM2313 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2313 RNA, herein designated GAM RNA, and which when bound by GAM2313 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2313 target proteins.

[32261] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2313 gene, herein designated GAM GENE, on one or more GAM2313 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32262] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2313 correlate with, and may be deduced from, the identity of the target genes which GAM2313 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32263] Nucleotide sequences of the GAM2313 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2313 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2313 are further described hereinbelow with reference to Table 1.

[32264] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2313 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32265] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2314 (GAM2314) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32266] GAM2314 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2314 was detected is described hereinabove with reference to Figs. 2-8.

[32267] GAM2314 gene, herein designated GAM GENE, and GAM2314 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32268] GAM2314 gene, herein designated GAM GENE, encodes a GAM2314 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2314 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2314 precursor RNA is designated SEQ ID:2291, and is provided hereinbelow with reference to the sequence listing part.

[32269] GAM2314 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2314 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32270] An enzyme complex designated DICER COMPLEX, dices the GAM2314 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2314 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2314 RNA is designated SEQ ID:4906, and is provided hereinbelow with reference to the sequence listing part.

[32271] GAM2314 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2314 target RNA, herein designated GAM TARGET RNA. GAM2314 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32272] GAM2314 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2314 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2314 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2314 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2314 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32273] The complementary binding of GAM2314 RNA, herein designated GAM RNA, to target binding sites on GAM2314 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2314 target RNA, herein designated GAM TARGET RNA, into GAM2314 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32274] It is appreciated that GAM2314 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2314 target genes. The mRNA of each one of this plurality of GAM2314 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2314 RNA, herein designated GAM RNA, and which when bound by GAM2314 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2314 target proteins.

[32275] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2314 gene, herein designated GAM GENE, on one or more GAM2314 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32276] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2314 correlate with, and may be deduced from, the identity of the target

genes which GAM2314 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32277] Nucleotide sequences of the GAM2314 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2314 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2314 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2314 are further described hereinbelow with reference to Table 1.

[32278] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2314 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32279] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2315 (GAM2315) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32280] GAM2315 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2315 was detected is described hereinabove with reference to Figs. 2-8.

[32281] GAM2315 gene, herein designated GAM GENE, and GAM2315 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[32282] GAM2315 gene, herein designated GAM GENE, encodes a GAM2315 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2315 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2315 precursor RNA is designated SEQ ID:2292, and is provided hereinbelow with reference to the sequence listing part.

[32283] GAM2315 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32284] An enzyme complex designated DICER COMPLEX, dices the GAM2315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2315 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2315 RNA is designated SEQ ID:4905, and is provided

hereinbelow with reference to the sequence listing part.

[32285] GAM2315 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2315 target RNA, herein designated GAM TARGET RNA. GAM2315 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32286] GAM2315 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2315 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2315 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2315 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2315 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32287] The complementary binding of GAM2315 RNA, herein designated GAM RNA, to target binding sites on GAM2315 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2315 target RNA, herein designated GAM TARGET RNA, into GAM2315 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32288] It is appreciated that GAM2315 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2315 target genes. The mRNA of each one of this plurality of GAM2315 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2315 RNA, herein designated GAM RNA, and which when bound by GAM2315 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2315 target proteins.

[32289] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2315 gene, herein designated GAM GENE, on one or more GAM2315 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32290] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2315 correlate with, and may be deduced from, the identity of the target genes which GAM2315 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32291] Nucleotide sequences of the GAM2315 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2315 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2315 are further described hereinbelow with reference to Table 1.

[32292] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2315 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32293] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2316 (GAM2316) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32294] GAM2316 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2316 was detected is described hereinabove with reference to Figs. 2-8.

[32295] GAM2316 gene, herein designated GAM GENE, and GAM2316 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32296] GAM2316 gene, herein designated GAM GENE, encodes a GAM2316 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2316 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2316 precursor RNA is designated SEQ ID:2293, and is provided hereinbelow with reference to the sequence listing part.

[32297] GAM2316 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2316 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32298] An enzyme complex designated DICER COMPLEX, dices the GAM2316 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2316 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2316 RNA is designated SEQ ID:4908, and is provided hereinbelow with reference to the sequence listing part.

[32299] GAM2316 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2316 target RNA, herein designated GAM TARGET RNA. GAM2316 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32300] GAM2316 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2316 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2316 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2316 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2316 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32301] The complementary binding of GAM2316 RNA, herein designated GAM RNA, to target binding sites on GAM2316 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2316 target RNA, herein designated GAM TARGET RNA, into GAM2316 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32302] It is appreciated that GAM2316 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2316 target genes. The mRNA of each one of this plurality of GAM2316 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2316 RNA, herein designated GAM RNA, and which when bound by GAM2316 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2316 target proteins.

[32303] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2316 gene, herein designated GAM GENE, on one or more GAM2316 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32304] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2316 correlate with, and may be deduced from, the identity of the target genes which GAM2316 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32305] Nucleotide sequences of the GAM2316 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2316 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2316 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2316 are further described hereinbelow with reference to Table 1.

[32306] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2316 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32307] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2317 (GAM2317) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32308] GAM2317 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2317 was detected is described hereinabove with reference to Figs. 2-8.

[32309] GAM2317 gene, herein designated GAM GENE, and GAM2317 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32310] GAM2317 gene, herein designated GAM GENE, encodes a GAM2317 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2317 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2317 precursor RNA is designated SEQ ID:2294, and is provided hereinbelow with reference to the sequence listing part.

[32311] GAM2317 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [32312] An enzyme complex designated DICER COMPLEX, dices the GAM2317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2317 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2317 RNA is designated SEQ ID:4907, and is provided hereinbelow with reference to the sequence listing part.
- [32313] GAM2317 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2317 target RNA, herein designated GAM TARGET RNA. GAM2317 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [32314] GAM2317 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2317 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2317 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2317 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2317 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32315] The complementary binding of GAM2317 RNA, herein designated GAM RNA, to target binding sites on GAM2317 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2317 target RNA, herein designated GAM TARGET RNA, into GAM2317 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32316] It is appreciated that GAM2317 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2317 target genes. The mRNA of each one of this plurality of GAM2317 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2317 RNA, herein designated GAM RNA, and which when bound by GAM2317 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2317 target proteins.

[32317] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2317 gene, herein designated GAM GENE, on one or more GAM2317 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32318] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2317 correlate with, and may be deduced from, the identity of the target genes which GAM2317 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32319] Nucleotide sequences of the GAM2317 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2317 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2317 are further described hereinbelow with reference to Table 1.

[32320] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2317 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[32321] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2318 (GAM2318) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32322] GAM2318 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2318 was detected is described hereinabove with reference to Figs. 2-8.

[32323] GAM2318 gene, herein designated GAM GENE, and GAM2318 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32324] GAM2318 gene, herein designated GAM GENE, encodes a GAM2318 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2318 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2318 precursor RNA is designated SEQ ID:2295, and is provided hereinbelow with reference to the sequence listing part.

[32325] GAM2318 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32326] An enzyme complex designated DICER COMPLEX, dices the GAM2318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2318 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2318 RNA is designated SEQ ID:4909, and is provided hereinbelow with reference to the sequence listing part.

[32327] GAM2318 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2318 target RNA, herein designated GAM TARGET RNA. GAM2318 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32328] GAM2318 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2318 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2318 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2318 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2318 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32329] The complementary binding of GAM2318 RNA, herein designated GAM RNA, to target binding sites on GAM2318 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2318 target RNA, herein designated GAM TARGET RNA, into GAM2318 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32330] It is appreciated that GAM2318 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2318 target genes. The mRNA of each one of this plurality of GAM2318 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2318 RNA, herein designated GAM RNA, and which when bound by GAM2318 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2318 target proteins.

[32331] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2318 gene, herein designated GAM GENE, on one or more GAM2318 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32332] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2318 correlate with, and may be deduced from, the identity of the target genes which GAM2318 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32333] Nucleotide sequences of the GAM2318 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2318 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2318 are further described hereinbelow with reference to Table 1.

- [32334] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2318 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [32335] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2319 (GAM2319) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [32336] GAM2319 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2319 was detected is described hereinabove with reference to Figs. 2-8.
- [32337] GAM2319 gene, herein designated GAM GENE, and GAM2319 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [32338] GAM2319 gene, herein designated GAM GENE, encodes a GAM2319 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2319 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2319 precursor RNA is designated SEQ ID:2296, and is provided hereinbelow with reference to the sequence listing part.

[32339] GAM2319 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32340] An enzyme complex designated DICER COMPLEX, dices the GAM2319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2319 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2319 RNA is designated SEQ ID:4910, and is provided hereinbelow with reference to the sequence listing part.

[32341] GAM2319 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2319 target RNA, herein designated GAM TARGET RNA. GAM2319 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32342] GAM2319 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2319 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2319 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2319 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2319 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32343] The complementary binding of GAM2319 RNA, herein designated GAM RNA, to target binding sites on GAM2319 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2319 target RNA, herein designated GAM TARGET RNA, into GAM2319 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32344] It is appreciated that GAM2319 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2319 target genes. The

mRNA of each one of this plurality of GAM2319 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2319 RNA, herein designated GAM RNA, and which when bound by GAM2319 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2319 target proteins.

[32345] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2319 gene, herein designated GAM GENE, on one or more GAM2319 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32346] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2319 correlate with, and may be deduced from, the identity of the target genes which GAM2319 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32347] Nucleotide sequences of the GAM2319 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2319 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2319 are further described hereinbelow with reference to Table 1.

[32348] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2319 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32349] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2320 (GAM2320) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32350] GAM2320 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2320 was detected is described hereinabove with reference to Figs. 2-8.

[32351] GAM2320 gene, herein designated GAM GENE, and GAM2320 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32352] GAM2320 gene, herein designated GAM GENE, encodes a GAM2320 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2320 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2320 precursor RNA is designated SEQ ID:2297, and is provided hereinbelow with reference to the sequence listing part.

[32353] GAM2320 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32354] An enzyme complex designated DICER COMPLEX, dices the GAM2320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2320 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2320 RNA is designated SEQ ID:4911, and is provided hereinbelow with reference to the sequence listing part.

[32355] GAM2320 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2320 target RNA, herein designated GAM TARGET RNA. GAM2320 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32356] GAM2320 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2320 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2320 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2320 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2320 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32357] The complementary binding of GAM2320 RNA, herein designated GAM RNA, to target binding sites on GAM2320 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2320 target RNA, herein designated GAM TARGET RNA, into GAM2320 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32358] It is appreciated that GAM2320 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2320 target genes. The mRNA of each one of this plurality of GAM2320 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2320 RNA, herein designated GAM RNA, and which when bound by GAM2320 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2320 target proteins.

[32359] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2320 gene, herein designated GAM GENE, on one or more GAM2320 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32360] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2320 correlate with, and may be deduced from, the identity of the target

genes which GAM2320 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32361] Nucleotide sequences of the GAM2320 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2320 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2320 are further described hereinbelow with reference to Table 1.

[32362] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2320 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32363] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2321 (GAM2321) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32364] GAM2321 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2321 was detected is described hereinabove with reference to Figs. 2-8.

[32365] GAM2321 gene, herein designated GAM GENE, and GAM2321 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[32366] GAM2321 gene, herein designated GAM GENE, encodes a GAM2321 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2321 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2321 precursor RNA is designated SEQ ID:2298, and is provided hereinbelow with reference to the sequence listing part.

[32367] GAM2321 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32368] An enzyme complex designated DICER COMPLEX, dices the GAM2321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2321 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2321 RNA is designated SEQ ID:4912, and is provided

hereinbelow with reference to the sequence listing part.

[32369] GAM2321 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2321 target RNA, herein designated GAM TARGET RNA. GAM2321 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32370] GAM2321 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2321 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2321 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2321 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2321 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32371] The complementary binding of GAM2321 RNA, herein designated GAM RNA, to target binding sites on GAM2321 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2321 target RNA, herein designated GAM TARGET RNA, into GAM2321 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32372] It is appreciated that GAM2321 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2321 target genes. The mRNA of each one of this plurality of GAM2321 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2321 RNA, herein designated GAM RNA, and which when bound by GAM2321 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2321 target proteins.

[32373] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2321 gene, herein designated GAM GENE, on one or more GAM2321 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32374] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2321 correlate with, and may be deduced from, the identity of the target genes which GAM2321 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32375] Nucleotide sequences of the GAM2321 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2321 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2321 are further described hereinbelow with reference to Table 1.

[32376] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2321 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32377] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2322 (GAM2322) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32378] GAM2322 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2322 was detected is described hereinabove with reference to Figs. 2-8.

[32379] GAM2322 gene, herein designated GAM GENE, and GAM2322 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32380] GAM2322 gene, herein designated GAM GENE, encodes a GAM2322 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2322 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2322 precursor RNA is designated SEQ ID:2299, and is provided hereinbelow with reference to the sequence listing part.

[32381] GAM2322 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32382] An enzyme complex designated DICER COMPLEX, dices the GAM2322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2322 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2322 RNA is designated SEQ ID:4913, and is provided hereinbelow with reference to the sequence listing part.

[32383] GAM2322 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2322 target RNA, herein designated GAM TARGET RNA. GAM2322 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32384] GAM2322 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2322 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2322 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2322 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2322 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32385] The complementary binding of GAM2322 RNA, herein designated GAM RNA, to target binding sites on GAM2322 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2322 target RNA, herein designated GAM TARGET RNA, into GAM2322 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32386] It is appreciated that GAM2322 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2322 target genes. The mRNA of each one of this plurality of GAM2322 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2322 RNA, herein designated GAM RNA, and which when bound by GAM2322 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2322 target proteins.

[32387] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2322 gene, herein designated GAM GENE, on one or more GAM2322 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32388] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2322 correlate with, and may be deduced from, the identity of the target genes which GAM2322 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32389] Nucleotide sequences of the GAM2322 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2322 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2322 are further described hereinbelow with reference to Table 1.

[32390] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2322 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32391] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2323 (GAM2323) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32392] GAM2323 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2323 was detected is described hereinabove with reference to Figs. 2-8.

[32393] GAM2323 gene, herein designated GAM GENE, and GAM2323 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32394] GAM2323 gene, herein designated GAM GENE, encodes a GAM2323 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2323 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2323 precursor RNA is designated SEQ ID:2300, and is provided hereinbelow with reference to the sequence listing part.

[32395] GAM2323 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2323 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [32396] An enzyme complex designated DICER COMPLEX, dices the GAM2323 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2323 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM2323 RNA is designated SEQ ID:4914, and is provided hereinbelow with reference to the sequence listing part.
- [32397] GAM2323 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2323 target RNA, herein designated GAM TARGET RNA. GAM2323 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [32398] GAM2323 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2323 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2323 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2323 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2323 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32399] The complementary binding of GAM2323 RNA, herein designated GAM RNA, to target binding sites on GAM2323 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2323 target RNA, herein designated GAM TARGET RNA, into GAM2323 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32400] It is appreciated that GAM2323 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2323 target genes. The mRNA of each one of this plurality of GAM2323 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2323 RNA, herein designated GAM RNA, and which when bound by GAM2323 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2323 target proteins.

[32401] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2323 gene, herein designated GAM GENE, on one or more GAM2323 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32402] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2323 correlate with, and may be deduced from, the identity of the target genes which GAM2323 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32403] Nucleotide sequences of the GAM2323 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2323 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2323 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2323 are further described hereinbelow with reference to Table 1.

[32404] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2323 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [32405] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2324 (GAM2324) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [32406] GAM2324 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2324 was detected is described hereinabove with reference to Figs. 2-8.
- [32407] GAM2324 gene, herein designated GAM GENE, and GAM2324 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [32408] GAM2324 gene, herein designated GAM GENE, encodes a GAM2324 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2324 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2324 precursor RNA is designated SEQ ID:2301, and is provided hereinbelow with reference to the sequence listing part.
- [32409] GAM2324 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32410] An enzyme complex designated DICER COMPLEX, dices the GAM2324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2324 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2324 RNA is designated SEQ ID:4915, and is provided hereinbelow with reference to the sequence listing part.

[32411] GAM2324 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2324 target RNA, herein designated GAM TARGET RNA. GAM2324 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32412] GAM2324 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2324 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2324 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2324 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2324 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32413] The complementary binding of GAM2324 RNA, herein designated GAM RNA, to target binding sites on GAM2324 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2324 target RNA, herein designated GAM TARGET RNA, into GAM2324 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32414] It is appreciated that GAM2324 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2324 target genes. The mRNA of each one of this plurality of GAM2324 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2324 RNA, herein designated GAM RNA, and which when bound by GAM2324 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2324 target proteins.

[32415] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2324 gene, herein designated GAM GENE, on one or more GAM2324 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32416] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2324 correlate with, and may be deduced from, the identity of the target genes which GAM2324 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32417] Nucleotide sequences of the GAM2324 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2324 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2324 are further described hereinbelow with reference to Table 1.

[32418] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2324 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32419] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2325 (GAM2325) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32420] GAM2325 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2325 was detected is described hereinabove with reference to Figs. 2-8.

[32421] GAM2325 gene, herein designated GAM GENE, and GAM2325 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32422] GAM2325 gene, herein designated GAM GENE, encodes a GAM2325 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2325 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2325 precursor RNA is designated SEQ ID:2302, and is provided hereinbelow with reference to the sequence listing part.

[32423] GAM2325 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32424] An enzyme complex designated DICER COMPLEX, dices the GAM2325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2325 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM2325 RNA is designated SEQ ID:4916, and is provided hereinbelow with reference to the sequence listing part.

[32425] GAM2325 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2325 target RNA, herein designated GAM TARGET RNA. GAM2325 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32426] GAM2325 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2325 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2325 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2325 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2325 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32427] The complementary binding of GAM2325 RNA, herein designated GAM RNA, to target binding sites on GAM2325 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2325 target RNA, herein designated GAM TARGET RNA, into GAM2325 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32428] It is appreciated that GAM2325 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2325 target genes. The

mRNA of each one of this plurality of GAM2325 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2325 RNA, herein designated GAM RNA, and which when bound by GAM2325 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2325 target proteins.

[32429] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2325 gene, herein designated GAM GENE, on one or more GAM2325 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32430] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2325 correlate with, and may be deduced from, the identity of the target genes which GAM2325 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32431] Nucleotide sequences of the GAM2325 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2325 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2325 are further described hereinbelow with reference to Table 1.

[32432] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2325 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32433] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2326 (GAM2326) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32434] GAM2326 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2326 was detected is described hereinabove with reference to Figs. 2-8.

[32435] GAM2326 gene, herein designated GAM GENE, and GAM2326 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32436] GAM2326 gene, herein designated GAM GENE, encodes a GAM2326 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2326 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2326 precursor RNA is designated SEQ ID:2303, and is provided hereinbelow with reference to the sequence listing part.

[32437] GAM2326 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32438] An enzyme complex designated DICER COMPLEX, dices the GAM2326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2326 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2326 RNA is designated SEQ ID:4917, and is provided hereinbelow with reference to the sequence listing part.

[32439] GAM2326 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2326 target RNA, herein designated GAM TARGET RNA. GAM2326 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32440] GAM2326 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2326 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2326 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2326 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2326 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32441] The complementary binding of GAM2326 RNA, herein designated GAM RNA, to target binding sites on GAM2326 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2326 target RNA, herein designated GAM TARGET RNA, into GAM2326 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32442] It is appreciated that GAM2326 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2326 target genes. The mRNA of each one of this plurality of GAM2326 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2326 RNA, herein designated GAM RNA, and which when bound by GAM2326 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2326 target proteins.

[32443] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2326 gene, herein designated GAM GENE, on one or more GAM2326 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32444] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2326 correlate with, and may be deduced from, the identity of the target

genes which GAM2326 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32445] Nucleotide sequences of the GAM2326 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2326 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2326 are further described hereinbelow with reference to Table 1.

[32446] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2326 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32447] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2327 (GAM2327) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32448] GAM2327 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2327 was detected is described hereinabove with reference to Figs. 2-8.

[32449] GAM2327 gene, herein designated GAM GENE, and GAM2327 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[32450] GAM2327 gene, herein designated GAM GENE, encodes a GAM2327 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2327 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2327 precursor RNA is designated SEQ ID:2304, and is provided hereinbelow with reference to the sequence listing part.

[32451] GAM2327 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32452] An enzyme complex designated DICER COMPLEX, dices the GAM2327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2327 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2327 RNA is designated SEQ ID:4919, and is provided

hereinbelow with reference to the sequence listing part.

[32453] GAM2327 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2327 target RNA, herein designated GAM TARGET RNA. GAM2327 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32454] GAM2327 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2327 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2327 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2327 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2327 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32455] The complementary binding of GAM2327 RNA, herein designated GAM RNA, to target binding sites on GAM2327 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2327 target RNA, herein designated GAM TARGET RNA, into GAM2327 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32456] It is appreciated that GAM2327 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2327 target genes. The mRNA of each one of this plurality of GAM2327 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2327 RNA, herein designated GAM RNA, and which when bound by GAM2327 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2327 target proteins.

[32457] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2327 gene, herein designated GAM GENE, on one or more GAM2327 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32458] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2327 correlate with, and may be deduced from, the identity of the target genes which GAM2327 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32459] Nucleotide sequences of the GAM2327 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2327 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2327 are further described hereinbelow with reference to Table 1.

[32460] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2327 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32461] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2328 (GAM2328) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32462] GAM2328 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2328 was detected is described hereinabove with reference to Figs. 2-8.

[32463] GAM2328 gene, herein designated GAM GENE, and GAM2328 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32464] GAM2328 gene, herein designated GAM GENE, encodes a GAM2328 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2328 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2328 precursor RNA is designated SEQ ID:2305, and is provided hereinbelow with reference to the sequence listing part.

[32465] GAM2328 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32466] An enzyme complex designated DICER COMPLEX, dices the GAM2328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2328 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2328 RNA is designated SEQ ID:4918, and is provided hereinbelow with reference to the sequence listing part.

[32467] GAM2328 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2328 target RNA, herein designated GAM TARGET RNA. GAM2328 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32468] GAM2328 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2328 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2328 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2328 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2328 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32469] The complementary binding of GAM2328 RNA, herein designated GAM RNA, to target binding sites on GAM2328 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2328 target RNA, herein designated GAM TARGET RNA, into GAM2328 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32470] It is appreciated that GAM2328 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2328 target genes. The mRNA of each one of this plurality of GAM2328 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2328 RNA, herein designated GAM RNA, and which when bound by GAM2328 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2328 target proteins.

[32471] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2328 gene, herein designated GAM GENE, on one or more GAM2328 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32472] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2328 correlate with, and may be deduced from, the identity of the target genes which GAM2328 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32473] Nucleotide sequences of the GAM2328 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2328 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2328 are further described hereinbelow with reference to Table 1.

[32474] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2328 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32475] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2329 (GAM2329) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32476] GAM2329 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2329 was detected is described hereinabove with reference to Figs. 2-8.

[32477] GAM2329 gene, herein designated GAM GENE, and GAM2329 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32478] GAM2329 gene, herein designated GAM GENE, encodes a GAM2329 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2329 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2329 precursor RNA is designated SEQ ID:2306, and is provided hereinbelow with reference to the sequence listing part.

[32479] GAM2329 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32480] An enzyme complex designated DICER COMPLEX, dices the GAM2329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2329 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2329 RNA is designated SEQ ID:4920, and is provided hereinbelow with reference to the sequence listing part.

[32481] GAM2329 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2329 target RNA, herein designated GAM TARGET RNA. GAM2329 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32482] GAM2329 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2329 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2329 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2329 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2329 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32483] The complementary binding of GAM2329 RNA, herein designated GAM RNA, to target binding sites on GAM2329 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2329 target RNA, herein designated GAM TARGET RNA, into GAM2329 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32484] It is appreciated that GAM2329 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2329 target genes. The mRNA of each one of this plurality of GAM2329 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2329 RNA, herein designated GAM RNA, and which when bound by GAM2329 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2329 target proteins.

[32485] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2329 gene, herein designated GAM GENE, on one or more GAM2329 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32486] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2329 correlate with, and may be deduced from, the identity of the target genes which GAM2329 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32487] Nucleotide sequences of the GAM2329 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2329 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2329 are further described hereinbelow with reference to Table 1.

[32488] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2329 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[32489] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2330 (GAM2330) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32490] GAM2330 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2330 was detected is described hereinabove with reference to Figs. 2-8.

[32491] GAM2330 gene, herein designated GAM GENE, and GAM2330 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32492] GAM2330 gene, herein designated GAM GENE, encodes a GAM2330 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2330 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2330 precursor RNA is designated SEQ ID:2307, and is provided hereinbelow with reference to the sequence listing part.

[32493] GAM2330 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32494] An enzyme complex designated DICER COMPLEX, dices the GAM2330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2330 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2330 RNA is designated SEQ ID:4921, and is provided hereinbelow with reference to the sequence listing part.

[32495] GAM2330 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2330 target RNA, herein designated GAM TARGET RNA. GAM2330 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32496] GAM2330 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2330 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2330 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2330 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2330 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32497] The complementary binding of GAM2330 RNA, herein designated GAM RNA, to target binding sites on GAM2330 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2330 target RNA, herein designated GAM TARGET RNA, into GAM2330 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32498] It is appreciated that GAM2330 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2330 target genes. The mRNA of each one of this plurality of GAM2330 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2330 RNA, herein designated GAM RNA, and which when bound by GAM2330 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2330 target proteins.

[32499] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2330 gene, herein designated GAM GENE, on one or more GAM2330 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32500] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2330 correlate with, and may be deduced from, the identity of the target genes which GAM2330 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32501] Nucleotide sequences of the GAM2330 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2330 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2330 are further described hereinbelow with reference to Table 1.

[32502] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2330 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32503] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2331 (GAM2331) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32504] GAM2331 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2331 was detected is described hereinabove with reference to Figs. 2-8.

[32505] GAM2331 gene, herein designated GAM GENE, and GAM2331 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32506] GAM2331 gene, herein designated GAM GENE, encodes a GAM2331 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2331 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2331 precursor RNA is designated SEQ ID:2308, and is provided hereinbelow with reference to the sequence listing part.

[32507] GAM2331 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32508] An enzyme complex designated DICER COMPLEX, dices the GAM2331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2331 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2331 RNA is designated SEQ ID:4922, and is provided hereinbelow with reference to the sequence listing part.

[32509] GAM2331 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2331 target RNA, herein designated GAM TARGET RNA. GAM2331 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32510] GAM2331 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2331 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2331 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2331 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2331 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32511] The complementary binding of GAM2331 RNA, herein designated GAM RNA, to target binding sites on GAM2331 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2331 target RNA, herein designated GAM TARGET RNA, into GAM2331 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32512] It is appreciated that GAM2331 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2331 target genes. The

mRNA of each one of this plurality of GAM2331 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2331 RNA, herein designated GAM RNA, and which when bound by GAM2331 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2331 target proteins.

[32513] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2331 gene, herein designated GAM GENE, on one or more GAM2331 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32514] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2331 correlate with, and may be deduced from, the identity of the target genes which GAM2331 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32515] Nucleotide sequences of the GAM2331 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2331 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2331 are further described hereinbelow with reference to Table 1.

[32516] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2331 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32517] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2332 (GAM2332) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32518] GAM2332 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2332 was detected is described hereinabove with reference to Figs. 2-8.

[32519] GAM2332 gene, herein designated GAM GENE, and GAM2332 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32520] GAM2332 gene, herein designated GAM GENE, encodes a GAM2332 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2332 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2332 precursor RNA is designated SEQ ID:2309, and is provided hereinbelow with reference to the sequence listing part.

[32521] GAM2332 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32522] An enzyme complex designated DICER COMPLEX, dices the GAM2332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2332 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2332 RNA is designated SEQ ID:4923, and is provided hereinbelow with reference to the sequence listing part.

[32523] GAM2332 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2332 target RNA, herein designated GAM TARGET RNA. GAM2332 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32524] GAM2332 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2332 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2332 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2332 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2332 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32525] The complementary binding of GAM2332 RNA, herein designated GAM RNA, to target binding sites on GAM2332 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2332 target RNA, herein designated GAM TARGET RNA, into GAM2332 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32526] It is appreciated that GAM2332 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2332 target genes. The mRNA of each one of this plurality of GAM2332 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2332 RNA, herein designated GAM RNA, and which when bound by GAM2332 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2332 target proteins.

[32527] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2332 gene, herein designated GAM GENE, on one or more GAM2332 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32528] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2332 correlate with, and may be deduced from, the identity of the target

genes which GAM2332 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32529] Nucleotide sequences of the GAM2332 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2332 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2332 are further described hereinbelow with reference to Table 1.

[32530] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2332 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32531] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2333 (GAM2333) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32532] GAM2333 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2333 was detected is described hereinabove with reference to Figs. 2-8.

[32533] GAM2333 gene, herein designated GAM GENE, and GAM2333 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[32534] GAM2333 gene, herein designated GAM GENE, encodes a GAM2333 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2333 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2333 precursor RNA is designated SEQ ID:2310, and is provided hereinbelow with reference to the sequence listing part.

[32535] GAM2333 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32536] An enzyme complex designated DICER COMPLEX, dices the GAM2333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2333 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2333 RNA is designated SEQ ID:4924, and is provided

hereinbelow with reference to the sequence listing part.

[32537] GAM2333 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2333 target RNA, herein designated GAM TARGET RNA. GAM2333 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32538] GAM2333 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2333 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2333 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2333 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2333 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32539] The complementary binding of GAM2333 RNA, herein designated GAM RNA, to target binding sites on GAM2333 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2333 target RNA, herein designated GAM TARGET RNA, into GAM2333 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32540] It is appreciated that GAM2333 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2333 target genes. The mRNA of each one of this plurality of GAM2333 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2333 RNA, herein designated GAM RNA, and which when bound by GAM2333 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2333 target proteins.

[32541] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2333 gene, herein designated GAM GENE, on one or more GAM2333 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32542] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2333 correlate with, and may be deduced from, the identity of the target genes which GAM2333 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32543] Nucleotide sequences of the GAM2333 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2333 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2333 are further described hereinbelow with reference to Table 1.

[32544] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2333 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32545] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2334 (GAM2334) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32546] GAM2334 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2334 was detected is described hereinabove with reference to Figs. 2-8.

[32547] GAM2334 gene, herein designated GAM GENE, and GAM2334 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32548] GAM2334 gene, herein designated GAM GENE, encodes a GAM2334 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2334 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2334 precursor RNA is designated SEQ ID:2311, and is provided hereinbelow with reference to the sequence listing part.

[32549] GAM2334 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32550] An enzyme complex designated DICER COMPLEX, dices the GAM2334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2334 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2334 RNA is designated SEQ ID:4925, and is provided hereinbelow with reference to the sequence listing part.

[32551] GAM2334 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2334 target RNA, herein designated GAM TARGET RNA. GAM2334 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32552] GAM2334 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2334 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2334 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2334 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2334 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32553] The complementary binding of GAM2334 RNA, herein designated GAM RNA, to target binding sites on GAM2334 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2334 target RNA, herein designated GAM TARGET RNA, into GAM2334 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32554] It is appreciated that GAM2334 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2334 target genes. The mRNA of each one of this plurality of GAM2334 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2334 RNA, herein designated GAM RNA, and which when bound by GAM2334 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2334 target proteins.

[32555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2334 gene, herein designated GAM GENE, on one or more GAM2334 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32556] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2334 correlate with, and may be deduced from, the identity of the target genes which GAM2334 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32557] Nucleotide sequences of the GAM2334 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2334 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2334 are further described hereinbelow with reference to Table 1.

[32558] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2334 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32559] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2335 (GAM2335) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32560] GAM2335 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2335 was detected is described hereinabove with reference to Figs. 2-8.

[32561] GAM2335 gene, herein designated GAM GENE, and GAM2335 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32562] GAM2335 gene, herein designated GAM GENE, encodes a GAM2335 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2335 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2335 precursor RNA is designated SEQ ID:2312, and is provided hereinbelow with reference to the sequence listing part.

[32563] GAM2335 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [32564] An enzyme complex designated DICER COMPLEX, dices the GAM2335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2335 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2335 RNA is designated SEQ ID:4926, and is provided hereinbelow with reference to the sequence listing part.
- [32565] GAM2335 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2335 target RNA, herein designated GAM TARGET RNA. GAM2335 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [32566] GAM2335 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2335 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2335 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2335 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2335 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32567] The complementary binding of GAM2335 RNA, herein designated GAM RNA, to target binding sites on GAM2335 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2335 target RNA, herein designated GAM TARGET RNA, into GAM2335 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32568] It is appreciated that GAM2335 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2335 target genes. The mRNA of each one of this plurality of GAM2335 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2335 RNA, herein designated GAM RNA, and which when bound by GAM2335 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2335 target proteins.

[32569] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2335 gene, herein designated GAM GENE, on one or more GAM2335 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32570] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2335 correlate with, and may be deduced from, the identity of the target genes which GAM2335 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32571] Nucleotide sequences of the GAM2335 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2335 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2335 are further described hereinbelow with reference to Table 1.

[32572] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2335 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[32573] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2336 (GAM2336) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32574] GAM2336 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2336 was detected is described hereinabove with reference to Figs. 2-8.

[32575] GAM2336 gene, herein designated GAM GENE, and GAM2336 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32576] GAM2336 gene, herein designated GAM GENE, encodes a GAM2336 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2336 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2336 precursor RNA is designated SEQ ID:2313, and is provided hereinbelow with reference to the sequence listing part.

[32577] GAM2336 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32578] An enzyme complex designated DICER COMPLEX, dices the GAM2336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2336 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2336 RNA is designated SEQ ID:4927, and is provided hereinbelow with reference to the sequence listing part.

[32579] GAM2336 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2336 target RNA, herein designated GAM TARGET RNA. GAM2336 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32580] GAM2336 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2336 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2336 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2336 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2336 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32581] The complementary binding of GAM2336 RNA, herein designated GAM RNA, to target binding sites on GAM2336 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2336 target RNA, herein designated GAM TARGET RNA, into GAM2336 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32582] It is appreciated that GAM2336 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2336 target genes. The mRNA of each one of this plurality of GAM2336 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2336 RNA, herein designated GAM RNA, and which when bound by GAM2336 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2336 target proteins.

[32583] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2336 gene, herein designated GAM GENE, on one or more GAM2336 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32584] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2336 correlate with, and may be deduced from, the identity of the target genes which GAM2336 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32585] Nucleotide sequences of the GAM2336 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2336 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2336 are further described hereinbelow with reference to Table 1.

[32586] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2336 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32587] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2337 (GAM2337) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32588] GAM2337 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2337 was detected is described hereinabove with reference to Figs. 2-8.

[32589] GAM2337 gene, herein designated GAM GENE, and GAM2337 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32590] GAM2337 gene, herein designated GAM GENE, encodes a GAM2337 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2337 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2337 precursor RNA is designated SEQ ID:2314, and is provided hereinbelow with reference to the sequence listing part.

[32591] GAM2337 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32592] An enzyme complex designated DICER COMPLEX, dices the GAM2337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2337 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2337 RNA is designated SEQ ID:4928, and is provided hereinbelow with reference to the sequence listing part.

[32593] GAM2337 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2337 target RNA, herein designated GAM TARGET RNA. GAM2337 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32594] GAM2337 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2337 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2337 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2337 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2337 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32595] The complementary binding of GAM2337 RNA, herein designated GAM RNA, to target binding sites on GAM2337 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2337 target RNA, herein designated GAM TARGET RNA, into GAM2337 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32596] It is appreciated that GAM2337 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2337 target genes. The

mRNA of each one of this plurality of GAM2337 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2337 RNA, herein designated GAM RNA, and which when bound by GAM2337 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2337 target proteins.

[32597] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2337 gene, herein designated GAM GENE, on one or more GAM2337 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32598] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2337 correlate with, and may be deduced from, the identity of the target genes which GAM2337 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32599] Nucleotide sequences of the GAM2337 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2337 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2337 are further described hereinbelow with reference to Table 1.

[32600] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2337 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32601] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2338 (GAM2338) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32602] GAM2338 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2338 was detected is described hereinabove with reference to Figs. 2-8.

[32603] GAM2338 gene, herein designated GAM GENE, and GAM2338 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32604] GAM2338 gene, herein designated GAM GENE, encodes a GAM2338 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2338 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2338 precursor RNA is designated SEQ ID:2315, and is provided hereinbelow with reference to the sequence listing part.

[32605] GAM2338 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32606] An enzyme complex designated DICER COMPLEX, dices the GAM2338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2338 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2338 RNA is designated SEQ ID:4929, and is provided hereinbelow with reference to the sequence listing part.

[32607] GAM2338 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2338 target RNA, herein designated GAM TARGET RNA. GAM2338 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32608] GAM2338 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2338 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2338 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2338 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2338 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32609] The complementary binding of GAM2338 RNA, herein designated GAM RNA, to target binding sites on GAM2338 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2338 target RNA, herein designated GAM TARGET RNA, into GAM2338 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32610] It is appreciated that GAM2338 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2338 target genes. The mRNA of each one of this plurality of GAM2338 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2338 RNA, herein designated GAM RNA, and which when bound by GAM2338 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2338 target proteins.

[32611] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2338 gene, herein designated GAM GENE, on one or more GAM2338 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32612] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2338 correlate with, and may be deduced from, the identity of the target

genes which GAM2338 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32613] Nucleotide sequences of the GAM2338 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2338 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2338 are further described hereinbelow with reference to Table 1.

[32614] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2338 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32615] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2339 (GAM2339) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32616] GAM2339 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2339 was detected is described hereinabove with reference to Figs. 2-8.

[32617] GAM2339 gene, herein designated GAM GENE, and GAM2339 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[32618] GAM2339 gene, herein designated GAM GENE, encodes a GAM2339 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2339 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2339 precursor RNA is designated SEQ ID:2316, and is provided hereinbelow with reference to the sequence listing part.

[32619] GAM2339 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32620] An enzyme complex designated DICER COMPLEX, dices the GAM2339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2339 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2339 RNA is designated SEQ ID:4930, and is provided

hereinbelow with reference to the sequence listing part.

[32621] GAM2339 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2339 target RNA, herein designated GAM TARGET RNA. GAM2339 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32622] GAM2339 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2339 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2339 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2339 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2339 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32623] The complementary binding of GAM2339 RNA, herein designated GAM RNA, to target binding sites on GAM2339 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2339 target RNA, herein designated GAM TARGET RNA, into GAM2339 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32624] It is appreciated that GAM2339 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2339 target genes. The mRNA of each one of this plurality of GAM2339 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2339 RNA, herein designated GAM RNA, and which when bound by GAM2339 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2339 target proteins.

[32625] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2339 gene, herein designated GAM GENE, on one or more GAM2339 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32626] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2339 correlate with, and may be deduced from, the identity of the target genes which GAM2339 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32627] Nucleotide sequences of the GAM2339 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2339 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2339 are further described hereinbelow with reference to Table 1.

[32628] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2339 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32629] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2340 (GAM2340) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32630] GAM2340 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2340 was detected is described hereinabove with reference to Figs. 2-8.

[32631] GAM2340 gene, herein designated GAM GENE, and GAM2340 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32632] GAM2340 gene, herein designated GAM GENE, encodes a GAM2340 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2340 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2340 precursor RNA is designated SEQ ID:2317, and is provided hereinbelow with reference to the sequence listing part.

[32633] GAM2340 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [32634] An enzyme complex designated DICER COMPLEX, dices the GAM2340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2340 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2340 RNA is designated SEQ ID:4931, and is provided hereinbelow with reference to the sequence listing part.
- [32635] GAM2340 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2340 target RNA, herein designated GAM TARGET RNA. GAM2340 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [32636] GAM2340 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2340 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2340 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2340 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2340 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32637] The complementary binding of GAM2340 RNA, herein designated GAM RNA, to target binding sites on GAM2340 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2340 target RNA, herein designated GAM TARGET RNA, into GAM2340 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32638] It is appreciated that GAM2340 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2340 target genes. The mRNA of each one of this plurality of GAM2340 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2340 RNA, herein designated GAM RNA, and which when bound by GAM2340 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2340 target proteins.

[32639] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2340 gene, herein designated GAM GENE, on one or more GAM2340 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32640] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2340 correlate with, and may be deduced from, the identity of the target genes which GAM2340 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32641] Nucleotide sequences of the GAM2340 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2340 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2340 are further described hereinbelow with reference to Table 1.

[32642] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2340 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[32643] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2341 (GAM2341) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32644] GAM2341 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2341 was detected is described hereinabove with reference to Figs. 2-8.

[32645] GAM2341 gene, herein designated GAM GENE, and GAM2341 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32646] GAM2341 gene, herein designated GAM GENE, encodes a GAM2341 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2341 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2341 precursor RNA is designated SEQ ID:2318, and is provided hereinbelow with reference to the sequence listing part.

[32647] GAM2341 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32648] An enzyme complex designated DICER COMPLEX, dices the GAM2341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2341 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2341 RNA is designated SEQ ID:4932, and is provided hereinbelow with reference to the sequence listing part.

[32649] GAM2341 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2341 target RNA, herein designated GAM TARGET RNA. GAM2341 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32650] GAM2341 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2341 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2341 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2341 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2341 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32651] The complementary binding of GAM2341 RNA, herein designated GAM RNA, to target binding sites on GAM2341 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2341 target RNA, herein designated GAM TARGET RNA, into GAM2341 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32652] It is appreciated that GAM2341 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2341 target genes. The mRNA of each one of this plurality of GAM2341 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2341 RNA, herein designated GAM RNA, and which when bound by GAM2341 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2341 target proteins.

[32653] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2341 gene, herein designated GAM GENE, on one or more GAM2341 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32654] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2341 correlate with, and may be deduced from, the identity of the target genes which GAM2341 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32655] Nucleotide sequences of the GAM2341 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2341 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2341 are further described hereinbelow with reference to Table 1.

[32656] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2341 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32657] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2342 (GAM2342) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32658] GAM2342 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2342 was detected is described hereinabove with reference to Figs. 2-8.

[32659] GAM2342 gene, herein designated GAM GENE, and GAM2342 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32660] GAM2342 gene, herein designated GAM GENE, encodes a GAM2342 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2342 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2342 precursor RNA is designated SEQ ID:2319, and is provided hereinbelow with reference to the sequence listing part.

[32661] GAM2342 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32662] An enzyme complex designated DICER COMPLEX, dices the GAM2342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2342 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2342 RNA is designated SEQ ID:4933, and is provided hereinbelow with reference to the sequence listing part.

[32663] GAM2342 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2342 target RNA, herein designated GAM TARGET RNA. GAM2342 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32664] GAM2342 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2342 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2342 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2342 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2342 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32665] The complementary binding of GAM2342 RNA, herein designated GAM RNA, to target binding sites on GAM2342 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2342 target RNA, herein designated GAM TARGET RNA, into GAM2342 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32666] It is appreciated that GAM2342 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2342 target genes. The

mRNA of each one of this plurality of GAM2342 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2342 RNA, herein designated GAM RNA, and which when bound by GAM2342 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2342 target proteins.

[32667] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2342 gene, herein designated GAM GENE, on one or more GAM2342 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32668] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2342 correlate with, and may be deduced from, the identity of the target genes which GAM2342 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32669] Nucleotide sequences of the GAM2342 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2342 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2342 are further described hereinbelow with reference to Table 1.

[32670] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2342 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32671] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2343 (GAM2343) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32672] GAM2343 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2343 was detected is described hereinabove with reference to Figs. 2-8.

[32673] GAM2343 gene, herein designated GAM GENE, and GAM2343 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32674] GAM2343 gene, herein designated GAM GENE, encodes a GAM2343 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2343 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2343 precursor RNA is designated SEQ ID:2320, and is provided hereinbelow with reference to the sequence listing part.

[32675] GAM2343 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32676] An enzyme complex designated DICER COMPLEX, dices the GAM2343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2343 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM2343 RNA is designated SEQ ID:4934, and is provided hereinbelow with reference to the sequence listing part.

[32677] GAM2343 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2343 target RNA, herein designated GAM TARGET RNA. GAM2343 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32678] GAM2343 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2343 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2343 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2343 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2343 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32679] The complementary binding of GAM2343 RNA, herein designated GAM RNA, to target binding sites on GAM2343 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2343 target RNA, herein designated GAM TARGET RNA, into GAM2343 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32680] It is appreciated that GAM2343 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2343 target genes. The mRNA of each one of this plurality of GAM2343 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2343 RNA, herein designated GAM RNA, and which when bound by GAM2343 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2343 target proteins.

[32681] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2343 gene, herein designated GAM GENE, on one or more GAM2343 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32682] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2343 correlate with, and may be deduced from, the identity of the target

genes which GAM2343 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32683] Nucleotide sequences of the GAM2343 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2343 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2343 are further described hereinbelow with reference to Table 1.

[32684] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2343 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32685] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2344 (GAM2344) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32686] GAM2344 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2344 was detected is described hereinabove with reference to Figs. 2-8.

[32687] GAM2344 gene, herein designated GAM GENE, and GAM2344 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[32688] GAM2344 gene, herein designated GAM GENE, encodes a GAM2344 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2344 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2344 precursor RNA is designated SEQ ID:2321, and is provided hereinbelow with reference to the sequence listing part.

[32689] GAM2344 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32690] An enzyme complex designated DICER COMPLEX, dices the GAM2344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2344 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2344 RNA is designated SEQ ID:4935, and is provided

hereinbelow with reference to the sequence listing part.

[32691] GAM2344 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2344 target RNA, herein designated GAM TARGET RNA. GAM2344 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32692] GAM2344 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2344 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2344 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2344 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2344 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32693] The complementary binding of GAM2344 RNA, herein designated GAM RNA, to target binding sites on GAM2344 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2344 target RNA, herein designated GAM TARGET RNA, into GAM2344 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32694] It is appreciated that GAM2344 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2344 target genes. The mRNA of each one of this plurality of GAM2344 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2344 RNA, herein designated GAM RNA, and which when bound by GAM2344 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2344 target proteins.

[32695] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2344 gene, herein designated GAM GENE, on one or more GAM2344 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32696] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2344 correlate with, and may be deduced from, the identity of the target genes which GAM2344 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32697] Nucleotide sequences of the GAM2344 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2344 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2344 are further described hereinbelow with reference to Table 1.

[32698] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2344 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32699] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2345 (GAM2345) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32700] GAM2345 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2345 was detected is described hereinabove with reference to Figs. 2-8.

[32701] GAM2345 gene, herein designated GAM GENE, and GAM2345 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32702] GAM2345 gene, herein designated GAM GENE, encodes a GAM2345 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2345 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2345 precursor RNA is designated SEQ ID:2322, and is provided hereinbelow with reference to the sequence listing part.

[32703] GAM2345 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32704] An enzyme complex designated DICER COMPLEX, dices the GAM2345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2345 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2345 RNA is designated SEQ ID:4936, and is provided hereinbelow with reference to the sequence listing part.

[32705] GAM2345 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2345 target RNA, herein designated GAM TARGET RNA. GAM2345 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32706] GAM2345 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2345 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2345 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2345 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2345 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32707] The complementary binding of GAM2345 RNA, herein designated GAM RNA, to target binding sites on GAM2345 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2345 target RNA, herein designated GAM TARGET RNA, into GAM2345 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32708] It is appreciated that GAM2345 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2345 target genes. The mRNA of each one of this plurality of GAM2345 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2345 RNA, herein designated GAM RNA, and which when bound by GAM2345 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2345 target proteins.

[32709] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2345 gene, herein designated GAM GENE, on one or more GAM2345 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32710] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2345 correlate with, and may be deduced from, the identity of the target genes which GAM2345 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32711] Nucleotide sequences of the GAM2345 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2345 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2345 are further described hereinbelow with reference to Table 1.

[32712] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2345 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32713] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2346 (GAM2346) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32714] GAM2346 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2346 was detected is described hereinabove with reference to Figs. 2-8.

[32715] GAM2346 gene, herein designated GAM GENE, and GAM2346 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32716] GAM2346 gene, herein designated GAM GENE, encodes a GAM2346 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2346 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2346 precursor RNA is designated SEQ ID:2323, and is provided hereinbelow with reference to the sequence listing part.

[32717] GAM2346 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32718] An enzyme complex designated DICER COMPLEX, dices the GAM2346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2346 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM2346 RNA is designated SEQ ID:4937, and is provided hereinbelow with reference to the sequence listing part.

[32719] GAM2346 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2346 target RNA, herein designated GAM TARGET RNA. GAM2346 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32720] GAM2346 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2346 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2346 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2346 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2346 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32721] The complementary binding of GAM2346 RNA, herein designated GAM RNA, to target binding sites on GAM2346 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2346 target RNA, herein designated GAM TARGET RNA, into GAM2346 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32722] It is appreciated that GAM2346 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2346 target genes. The mRNA of each one of this plurality of GAM2346 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2346 RNA, herein designated GAM RNA, and which when bound by GAM2346 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2346 target proteins.

[32723] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2346 gene, herein designated GAM GENE, on one or more GAM2346 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32724] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2346 correlate with, and may be deduced from, the identity of the target genes which GAM2346 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32725] Nucleotide sequences of the GAM2346 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2346 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2346 are further described hereinbelow with reference to Table 1.

[32726] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2346 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[32727] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2347 (GAM2347) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32728] GAM2347 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2347 was detected is described hereinabove with reference to Figs. 2-8.

[32729] GAM2347 gene, herein designated GAM GENE, and GAM2347 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32730] GAM2347 gene, herein designated GAM GENE, encodes a GAM2347 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2347 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2347 precursor RNA is designated SEQ ID:2324, and is provided hereinbelow with reference to the sequence listing part.

[32731] GAM2347 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32732] An enzyme complex designated DICER COMPLEX, dices the GAM2347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2347 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM2347 RNA is designated SEQ ID:4938, and is provided hereinbelow with reference to the sequence listing part.

[32733] GAM2347 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2347 target RNA, herein designated GAM TARGET RNA. GAM2347 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32734] GAM2347 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2347 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2347 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2347 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2347 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32735] The complementary binding of GAM2347 RNA, herein designated GAM RNA, to target binding sites on GAM2347 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2347 target RNA, herein designated GAM TARGET RNA, into GAM2347 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32736] It is appreciated that GAM2347 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2347 target genes. The mRNA of each one of this plurality of GAM2347 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2347 RNA, herein designated GAM RNA, and which when bound by GAM2347 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2347 target proteins.

[32737] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2347 gene, herein designated GAM GENE, on one or more GAM2347 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32738] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2347 correlate with, and may be deduced from, the identity of the target genes which GAM2347 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32739] Nucleotide sequences of the GAM2347 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2347 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2347 are further described hereinbelow with reference to Table 1.

[32740] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2347 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32741] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2348 (GAM2348) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32742] GAM2348 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2348 was detected is described hereinabove with reference to Figs. 2-8.

[32743] GAM2348 gene, herein designated GAM GENE, and GAM2348 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32744] GAM2348 gene, herein designated GAM GENE, encodes a GAM2348 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2348 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2348 precursor RNA is designated SEQ ID:2325, and is provided hereinbelow with reference to the sequence listing part.

[32745] GAM2348 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32746] An enzyme complex designated DICER COMPLEX, dices the GAM2348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2348 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2348 RNA is designated SEQ ID:4939, and is provided hereinbelow with reference to the sequence listing part.

[32747] GAM2348 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2348 target RNA, herein designated GAM TARGET RNA. GAM2348 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32748] GAM2348 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2348 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2348 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2348 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2348 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32749] The complementary binding of GAM2348 RNA, herein designated GAM RNA, to target binding sites on GAM2348 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2348 target RNA, herein designated GAM TARGET RNA, into GAM2348 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32750] It is appreciated that GAM2348 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2348 target genes. The

mRNA of each one of this plurality of GAM2348 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2348 RNA, herein designated GAM RNA, and which when bound by GAM2348 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2348 target proteins.

[32751] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2348 gene, herein designated GAM GENE, on one or more GAM2348 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32752] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2348 correlate with, and may be deduced from, the identity of the target genes which GAM2348 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32753] Nucleotide sequences of the GAM2348 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2348 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2348 are further described hereinbelow with reference to Table 1.

[32754] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2348 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32755] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2349 (GAM2349) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32756] GAM2349 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2349 was detected is described hereinabove with reference to Figs. 2-8.

[32757] GAM2349 gene, herein designated GAM GENE, and GAM2349 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32758] GAM2349 gene, herein designated GAM GENE, encodes a GAM2349 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2349 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2349 precursor RNA is designated SEQ ID:2326, and is provided hereinbelow with reference to the sequence listing part.

[32759] GAM2349 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32760] An enzyme complex designated DICER COMPLEX, dices the GAM2349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2349 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2349 RNA is designated SEQ ID:4940, and is provided hereinbelow with reference to the sequence listing part.

[32761] GAM2349 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2349 target RNA, herein designated GAM TARGET RNA. GAM2349 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32762] GAM2349 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2349 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2349 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2349 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2349 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32763] The complementary binding of GAM2349 RNA, herein designated GAM RNA, to target binding sites on GAM2349 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2349 target RNA, herein designated GAM TARGET RNA, into GAM2349 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32764] It is appreciated that GAM2349 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2349 target genes. The mRNA of each one of this plurality of GAM2349 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2349 RNA, herein designated GAM RNA, and which when bound by GAM2349 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2349 target proteins.

[32765] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2349 gene, herein designated GAM GENE, on one or more GAM2349 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32766] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2349 correlate with, and may be deduced from, the identity of the target

genes which GAM2349 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32767] Nucleotide sequences of the GAM2349 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2349 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2349 are further described hereinbelow with reference to Table 1.

[32768] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2349 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32769] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2350 (GAM2350) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32770] GAM2350 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2350 was detected is described hereinabove with reference to Figs. 2-8.

[32771] GAM2350 gene, herein designated GAM GENE, and GAM2350 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[32772] GAM2350 gene, herein designated GAM GENE, encodes a GAM2350 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2350 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2350 precursor RNA is designated SEQ ID:2327, and is provided hereinbelow with reference to the sequence listing part.

[32773] GAM2350 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32774] An enzyme complex designated DICER COMPLEX, dices the GAM2350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2350 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2350 RNA is designated SEQ ID:4941, and is provided

hereinbelow with reference to the sequence listing part.

[32775] GAM2350 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2350 target RNA, herein designated GAM TARGET RNA. GAM2350 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32776] GAM2350 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2350 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2350 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2350 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2350 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32777] The complementary binding of GAM2350 RNA, herein designated GAM RNA, to target binding sites on GAM2350 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2350 target RNA, herein designated GAM TARGET RNA, into GAM2350 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32778] It is appreciated that GAM2350 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2350 target genes. The mRNA of each one of this plurality of GAM2350 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2350 RNA, herein designated GAM RNA, and which when bound by GAM2350 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2350 target proteins.

[32779] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2350 gene, herein designated GAM GENE, on one or more GAM2350 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32780] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2350 correlate with, and may be deduced from, the identity of the target genes which GAM2350 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32781] Nucleotide sequences of the GAM2350 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2350 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2350 are further described hereinbelow with reference to Table 1.

[32782] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2350 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32783] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2351 (GAM2351) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32784] GAM2351 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2351 was detected is described hereinabove with reference to Figs. 2-8.

[32785] GAM2351 gene, herein designated GAM GENE, and GAM2351 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32786] GAM2351 gene, herein designated GAM GENE, encodes a GAM2351 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2351 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2351 precursor RNA is designated SEQ ID:2328, and is provided hereinbelow with reference to the sequence listing part.

[32787] GAM2351 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32788] An enzyme complex designated DICER COMPLEX, dices the GAM2351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2351 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2351 RNA is designated SEQ ID:4942, and is provided hereinbelow with reference to the sequence listing part.

[32789] GAM2351 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2351 target RNA, herein designated GAM TARGET RNA. GAM2351 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32790] GAM2351 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2351 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2351 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2351 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2351 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32791] The complementary binding of GAM2351 RNA, herein designated GAM RNA, to target binding sites on GAM2351 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2351 target RNA, herein designated GAM TARGET RNA, into GAM2351 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32792] It is appreciated that GAM2351 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2351 target genes. The mRNA of each one of this plurality of GAM2351 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2351 RNA, herein designated GAM RNA, and which when bound by GAM2351 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2351 target proteins.

[32793] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2351 gene, herein designated GAM GENE, on one or more GAM2351 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32794] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2351 correlate with, and may be deduced from, the identity of the target genes which GAM2351 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32795] Nucleotide sequences of the GAM2351 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2351 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2351 are further described hereinbelow with reference to Table 1.

[32796] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2351 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32797] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2352 (GAM2352) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32798] GAM2352 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2352 was detected is described hereinabove with reference to Figs. 2-8.

[32799] GAM2352 gene, herein designated GAM GENE, and GAM2352 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32800] GAM2352 gene, herein designated GAM GENE, encodes a GAM2352 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2352 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2352 precursor RNA is designated SEQ ID:2329, and is provided hereinbelow with reference to the sequence listing part.

[32801] GAM2352 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32802] An enzyme complex designated DICER COMPLEX, dices the GAM2352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2352 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2352 RNA is designated SEQ ID:4943, and is provided hereinbelow with reference to the sequence listing part.

[32803] GAM2352 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2352 target RNA, herein designated GAM TARGET RNA. GAM2352 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32804] GAM2352 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2352 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2352 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2352 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2352 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32805] The complementary binding of GAM2352 RNA, herein designated GAM RNA, to target binding sites on GAM2352 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2352 target RNA, herein designated GAM TARGET RNA, into GAM2352 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32806] It is appreciated that GAM2352 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2352 target genes. The mRNA of each one of this plurality of GAM2352 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2352 RNA, herein designated GAM RNA, and which when bound by GAM2352 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2352 target proteins.

[32807] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2352 gene, herein designated GAM GENE, on one or more GAM2352 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32808] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2352 correlate with, and may be deduced from, the identity of the target genes which GAM2352 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32809] Nucleotide sequences of the GAM2352 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2352 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2352 are further described hereinbelow with reference to Table 1.

[32810] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2352 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [32811] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2353 (GAM2353) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [32812] GAM2353 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2353 was detected is described hereinabove with reference to Figs. 2-8.
- [32813] GAM2353 gene, herein designated GAM GENE, and GAM2353 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [32814] GAM2353 gene, herein designated GAM GENE, encodes a GAM2353 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2353 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2353 precursor RNA is designated SEQ ID:2330, and is provided hereinbelow with reference to the sequence listing part.
- [32815] GAM2353 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32816] An enzyme complex designated DICER COMPLEX, dices the GAM2353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2353 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2353 RNA is designated SEQ ID:4944, and is provided hereinbelow with reference to the sequence listing part.

[32817] GAM2353 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2353 target RNA, herein designated GAM TARGET RNA. GAM2353 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32818] GAM2353 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2353 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2353 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2353 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2353 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32819] The complementary binding of GAM2353 RNA, herein designated GAM RNA, to target binding sites on GAM2353 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2353 target RNA, herein designated GAM TARGET RNA, into GAM2353 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32820] It is appreciated that GAM2353 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2353 target genes. The mRNA of each one of this plurality of GAM2353 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2353 RNA, herein designated GAM RNA, and which when bound by GAM2353 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2353 target proteins.

[32821] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2353 gene, herein designated GAM GENE, on one or more GAM2353 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32822] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2353 correlate with, and may be deduced from, the identity of the target genes which GAM2353 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32823] Nucleotide sequences of the GAM2353 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2353 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2353 are further described hereinbelow with reference to Table 1.

[32824] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2353 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32825] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2354 (GAM2354) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32826] GAM2354 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2354 was detected is described hereinabove with reference to Figs. 2-8.

[32827] GAM2354 gene, herein designated GAM GENE, and GAM2354 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32828] GAM2354 gene, herein designated GAM GENE, encodes a GAM2354 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2354 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2354 precursor RNA is designated SEQ ID:2331, and is provided hereinbelow with reference to the sequence listing part.

[32829] GAM2354 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32830] An enzyme complex designated DICER COMPLEX, dices the GAM2354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2354 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM2354 RNA is designated SEQ ID:4945, and is provided hereinbelow with reference to the sequence listing part.

[32831] GAM2354 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2354 target RNA, herein designated GAM TARGET RNA. GAM2354 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32832] GAM2354 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2354 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2354 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2354 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2354 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32833] The complementary binding of GAM2354 RNA, herein designated GAM RNA, to target binding sites on GAM2354 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2354 target RNA, herein designated GAM TARGET RNA, into GAM2354 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32834] It is appreciated that GAM2354 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2354 target genes. The

mRNA of each one of this plurality of GAM2354 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2354 RNA, herein designated GAM RNA, and which when bound by GAM2354 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2354 target proteins.

[32835] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2354 gene, herein designated GAM GENE, on one or more GAM2354 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32836] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2354 correlate with, and may be deduced from, the identity of the target genes which GAM2354 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32837] Nucleotide sequences of the GAM2354 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2354 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2354 are further described hereinbelow with reference to Table 1.

[32838] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2354 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32839] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2355 (GAM2355) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32840] GAM2355 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2355 was detected is described hereinabove with reference to Figs. 2-8.

[32841] GAM2355 gene, herein designated GAM GENE, and GAM2355 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32842] GAM2355 gene, herein designated GAM GENE, encodes a GAM2355 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2355 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2355 precursor RNA is designated SEQ ID:2332, and is provided hereinbelow with reference to the sequence listing part.

[32843] GAM2355 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2355 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32844] An enzyme complex designated DICER COMPLEX, dices the GAM2355 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2355 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2355 RNA is designated SEQ ID:4946, and is provided hereinbelow with reference to the sequence listing part.

[32845] GAM2355 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2355 target RNA, herein designated GAM TARGET RNA. GAM2355 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32846] GAM2355 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2355 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2355 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2355 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2355 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32847] The complementary binding of GAM2355 RNA, herein designated GAM RNA, to target binding sites on GAM2355 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2355 target RNA, herein designated GAM TARGET RNA, into GAM2355 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32848] It is appreciated that GAM2355 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2355 target genes. The mRNA of each one of this plurality of GAM2355 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2355 RNA, herein designated GAM RNA, and which when bound by GAM2355 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2355 target proteins.

[32849] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2355 gene, herein designated GAM GENE, on one or more GAM2355 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32850] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2355 correlate with, and may be deduced from, the identity of the target

genes which GAM2355 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32851] Nucleotide sequences of the GAM2355 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2355 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2355 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2355 are further described hereinbelow with reference to Table 1.

[32852] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2355 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32853] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2356 (GAM2356) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32854] GAM2356 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2356 was detected is described hereinabove with reference to Figs. 2-8.

[32855] GAM2356 gene, herein designated GAM GENE, and GAM2356 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[32856] GAM2356 gene, herein designated GAM GENE, encodes a GAM2356 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2356 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2356 precursor RNA is designated SEQ ID:2333, and is provided hereinbelow with reference to the sequence listing part.

[32857] GAM2356 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32858] An enzyme complex designated DICER COMPLEX, dices the GAM2356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2356 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2356 RNA is designated SEQ ID:4947, and is provided

hereinbelow with reference to the sequence listing part.

[32859] GAM2356 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2356 target RNA, herein designated GAM TARGET RNA. GAM2356 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32860] GAM2356 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2356 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2356 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2356 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2356 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32861] The complementary binding of GAM2356 RNA, herein designated GAM RNA, to target binding sites on GAM2356 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2356 target RNA, herein designated GAM TARGET RNA, into GAM2356 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32862] It is appreciated that GAM2356 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2356 target genes. The mRNA of each one of this plurality of GAM2356 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2356 RNA, herein designated GAM RNA, and which when bound by GAM2356 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2356 target proteins.

[32863] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2356 gene, herein designated GAM GENE, on one or more GAM2356 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32864] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2356 correlate with, and may be deduced from, the identity of the target genes which GAM2356 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32865] Nucleotide sequences of the GAM2356 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2356 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2356 are further described hereinbelow with reference to Table 1.

[32866] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2356 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32867] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2357 (GAM2357) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32868] GAM2357 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2357 was detected is described hereinabove with reference to Figs. 2-8.

[32869] GAM2357 gene, herein designated GAM GENE, and GAM2357 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32870] GAM2357 gene, herein designated GAM GENE, encodes a GAM2357 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2357 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2357 precursor RNA is designated SEQ ID:2334, and is provided hereinbelow with reference to the sequence listing part.

[32871] GAM2357 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32872] An enzyme complex designated DICER COMPLEX, dices the GAM2357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2357 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2357 RNA is designated SEQ ID:4948, and is provided hereinbelow with reference to the sequence listing part.

[32873] GAM2357 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2357 target RNA, herein designated GAM TARGET RNA. GAM2357 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32874] GAM2357 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2357 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2357 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2357 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2357 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32875] The complementary binding of GAM2357 RNA, herein designated GAM RNA, to target binding sites on GAM2357 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2357 target RNA, herein designated GAM TARGET RNA, into GAM2357 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32876] It is appreciated that GAM2357 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2357 target genes. The mRNA of each one of this plurality of GAM2357 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2357 RNA, herein designated GAM RNA, and which when bound by GAM2357 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2357 target proteins.

[32877] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2357 gene, herein designated GAM GENE, on one or more GAM2357 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32878] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2357 correlate with, and may be deduced from, the identity of the target genes which GAM2357 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32879] Nucleotide sequences of the GAM2357 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2357 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2357 are further described hereinbelow with reference to Table 1.

[32880] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2357 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32881] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2358 (GAM2358) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32882] GAM2358 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2358 was detected is described hereinabove with reference to Figs. 2-8.

[32883] GAM2358 gene, herein designated GAM GENE, and GAM2358 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32884] GAM2358 gene, herein designated GAM GENE, encodes a GAM2358 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2358 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2358 precursor RNA is designated SEQ ID:2335, and is provided hereinbelow with reference to the sequence listing part.

[32885] GAM2358 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [32886] An enzyme complex designated DICER COMPLEX, dices the GAM2358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2358 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2358 RNA is designated SEQ ID:4949, and is provided hereinbelow with reference to the sequence listing part.
- [32887] GAM2358 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2358 target RNA, herein designated GAM TARGET RNA. GAM2358 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [32888] GAM2358 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2358 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2358 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2358 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2358 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32889] The complementary binding of GAM2358 RNA, herein designated GAM RNA, to target binding sites on GAM2358 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2358 target RNA, herein designated GAM TARGET RNA, into GAM2358 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32890] It is appreciated that GAM2358 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2358 target genes. The mRNA of each one of this plurality of GAM2358 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2358 RNA, herein designated GAM RNA, and which when bound by GAM2358 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2358 target proteins.

[32891] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2358 gene, herein designated GAM GENE, on one or more GAM2358 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32892] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2358 correlate with, and may be deduced from, the identity of the target genes which GAM2358 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32893] Nucleotide sequences of the GAM2358 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2358 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2358 are further described hereinbelow with reference to Table 1.

[32894] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2358 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[32895] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2359 (GAM2359) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32896] GAM2359 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2359 was detected is described hereinabove with reference to Figs. 2-8.

[32897] GAM2359 gene, herein designated GAM GENE, and GAM2359 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32898] GAM2359 gene, herein designated GAM GENE, encodes a GAM2359 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2359 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2359 precursor RNA is designated SEQ ID:2336, and is provided hereinbelow with reference to the sequence listing part.

[32899] GAM2359 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32900] An enzyme complex designated DICER COMPLEX, dices the GAM2359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2359 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2359 RNA is designated SEQ ID:4950, and is provided hereinbelow with reference to the sequence listing part.

[32901] GAM2359 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2359 target RNA, herein designated GAM TARGET RNA. GAM2359 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32902] GAM2359 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2359 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2359 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2359 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2359 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32903] The complementary binding of GAM2359 RNA, herein designated GAM RNA, to target binding sites on GAM2359 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2359 target RNA, herein designated GAM TARGET RNA, into GAM2359 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32904] It is appreciated that GAM2359 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2359 target genes. The mRNA of each one of this plurality of GAM2359 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2359 RNA, herein designated GAM RNA, and which when bound by GAM2359 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2359 target proteins.

[32905] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2359 gene, herein designated GAM GENE, on one or more GAM2359 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32906] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2359 correlate with, and may be deduced from, the identity of the target genes which GAM2359 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32907] Nucleotide sequences of the GAM2359 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2359 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2359 are further described hereinbelow with reference to Table 1.

[32908] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2359 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32909] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2360 (GAM2360) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32910] GAM2360 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2360 was detected is described hereinabove with reference to Figs. 2-8.

[32911] GAM2360 gene, herein designated GAM GENE, and GAM2360 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32912] GAM2360 gene, herein designated GAM GENE, encodes a GAM2360 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2360 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2360 precursor RNA is designated SEQ ID:2337, and is provided hereinbelow with reference to the sequence listing part.

[32913] GAM2360 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2360 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32914] An enzyme complex designated DICER COMPLEX, dices the GAM2360 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2360 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2360 RNA is designated SEQ ID:4951, and is provided hereinbelow with reference to the sequence listing part.

[32915] GAM2360 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2360 target RNA, herein designated GAM TARGET RNA. GAM2360 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32916] GAM2360 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2360 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2360 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2360 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2360 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32917] The complementary binding of GAM2360 RNA, herein designated GAM RNA, to target binding sites on GAM2360 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2360 target RNA, herein designated GAM TARGET RNA, into GAM2360 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32918] It is appreciated that GAM2360 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2360 target genes. The

mRNA of each one of this plurality of GAM2360 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2360 RNA, herein designated GAM RNA, and which when bound by GAM2360 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2360 target proteins.

[32919] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2360 gene, herein designated GAM GENE, on one or more GAM2360 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32920] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2360 correlate with, and may be deduced from, the identity of the target genes which GAM2360 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32921] Nucleotide sequences of the GAM2360 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2360 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2360 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2360 are further described hereinbelow with reference to Table 1.

[32922] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2360 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32923] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2361 (GAM2361) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32924] GAM2361 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2361 was detected is described hereinabove with reference to Figs. 2-8.

[32925] GAM2361 gene, herein designated GAM GENE, and GAM2361 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32926] GAM2361 gene, herein designated GAM GENE, encodes a GAM2361 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2361 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2361 precursor RNA is designated SEQ ID:2338, and is provided hereinbelow with reference to the sequence listing part.

[32927] GAM2361 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32928] An enzyme complex designated DICER COMPLEX, dices the GAM2361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2361 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2361 RNA is designated SEQ ID:4952, and is provided hereinbelow with reference to the sequence listing part.

[32929] GAM2361 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2361 target RNA, herein designated GAM TARGET RNA. GAM2361 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32930] GAM2361 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2361 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2361 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2361 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2361 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32931] The complementary binding of GAM2361 RNA, herein designated GAM RNA, to target binding sites on GAM2361 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2361 target RNA, herein designated GAM TARGET RNA, into GAM2361 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32932] It is appreciated that GAM2361 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2361 target genes. The mRNA of each one of this plurality of GAM2361 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2361 RNA, herein designated GAM RNA, and which when bound by GAM2361 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2361 target proteins.

[32933] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2361 gene, herein designated GAM GENE, on one or more GAM2361 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32934] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2361 correlate with, and may be deduced from, the identity of the target

genes which GAM2361 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32935] Nucleotide sequences of the GAM2361 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2361 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2361 are further described hereinbelow with reference to Table 1.

[32936] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2361 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32937] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2362 (GAM2362) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32938] GAM2362 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2362 was detected is described hereinabove with reference to Figs. 2-8.

[32939] GAM2362 gene, herein designated GAM GENE, and GAM2362 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[32940] GAM2362 gene, herein designated GAM GENE, encodes a GAM2362 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2362 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2362 precursor RNA is designated SEQ ID:2339, and is provided hereinbelow with reference to the sequence listing part.

[32941] GAM2362 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32942] An enzyme complex designated DICER COMPLEX, dices the GAM2362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2362 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2362 RNA is designated SEQ ID:4953, and is provided

hereinbelow with reference to the sequence listing part.

[32943] GAM2362 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2362 target RNA, herein designated GAM TARGET RNA. GAM2362 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32944] GAM2362 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2362 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2362 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2362 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2362 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32945] The complementary binding of GAM2362 RNA, herein designated GAM RNA, to target binding sites on GAM2362 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2362 target RNA, herein designated GAM TARGET RNA, into GAM2362 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32946] It is appreciated that GAM2362 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2362 target genes. The mRNA of each one of this plurality of GAM2362 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2362 RNA, herein designated GAM RNA, and which when bound by GAM2362 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2362 target proteins.

[32947] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2362 gene, herein designated GAM GENE, on one or more GAM2362 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32948] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2362 correlate with, and may be deduced from, the identity of the target genes which GAM2362 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32949] Nucleotide sequences of the GAM2362 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2362 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2362 are further described hereinbelow with reference to Table 1.

[32950] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2362 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32951] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2363 (GAM2363) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32952] GAM2363 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2363 was detected is described hereinabove with reference to Figs. 2-8.

[32953] GAM2363 gene, herein designated GAM GENE, and GAM2363 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32954] GAM2363 gene, herein designated GAM GENE, encodes a GAM2363 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2363 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2363 precursor RNA is designated SEQ ID:2340, and is provided hereinbelow with reference to the sequence listing part.

[32955] GAM2363 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32956] An enzyme complex designated DICER COMPLEX, dices the GAM2363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2363 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2363 RNA is designated SEQ ID:4954, and is provided hereinbelow with reference to the sequence listing part.

[32957] GAM2363 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2363 target RNA, herein designated GAM TARGET RNA. GAM2363 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32958] GAM2363 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2363 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2363 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2363 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2363 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32959] The complementary binding of GAM2363 RNA, herein designated GAM RNA, to target binding sites on GAM2363 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2363 target RNA, herein designated GAM TARGET RNA, into GAM2363 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32960] It is appreciated that GAM2363 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2363 target genes. The mRNA of each one of this plurality of GAM2363 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2363 RNA, herein designated GAM RNA, and which when bound by GAM2363 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2363 target proteins.

[32961] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2363 gene, herein designated GAM GENE, on one or more GAM2363 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32962] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2363 correlate with, and may be deduced from, the identity of the target genes which GAM2363 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32963] Nucleotide sequences of the GAM2363 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2363 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2363 are further described hereinbelow with reference to Table 1.

[32964] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2363 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32965] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2364 (GAM2364) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32966] GAM2364 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2364 was detected is described hereinabove with reference to Figs. 2-8.

[32967] GAM2364 gene, herein designated GAM GENE, and GAM2364 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32968] GAM2364 gene, herein designated GAM GENE, encodes a GAM2364 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2364 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2364 precursor RNA is designated SEQ ID:2341, and is provided hereinbelow with reference to the sequence listing part.

[32969] GAM2364 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [32970] An enzyme complex designated DICER COMPLEX, dices the GAM2364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2364 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2364 RNA is designated SEQ ID:4955, and is provided hereinbelow with reference to the sequence listing part.
- [32971] GAM2364 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2364 target RNA, herein designated GAM TARGET RNA. GAM2364 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [32972] GAM2364 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2364 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2364 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2364 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2364 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32973] The complementary binding of GAM2364 RNA, herein designated GAM RNA, to target binding sites on GAM2364 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2364 target RNA, herein designated GAM TARGET RNA, into GAM2364 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32974] It is appreciated that GAM2364 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2364 target genes. The mRNA of each one of this plurality of GAM2364 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2364 RNA, herein designated GAM RNA, and which when bound by GAM2364 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2364 target proteins.

[32975] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2364 gene, herein designated GAM GENE, on one or more GAM2364 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32976] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2364 correlate with, and may be deduced from, the identity of the target genes which GAM2364 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32977] Nucleotide sequences of the GAM2364 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2364 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2364 are further described hereinbelow with reference to Table 1.

[32978] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2364 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[32979] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2365 (GAM2365) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32980] GAM2365 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2365 was detected is described hereinabove with reference to Figs. 2-8.

[32981] GAM2365 gene, herein designated GAM GENE, and GAM2365 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32982] GAM2365 gene, herein designated GAM GENE, encodes a GAM2365 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2365 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2365 precursor RNA is designated SEQ ID:2342, and is provided hereinbelow with reference to the sequence listing part.

[32983] GAM2365 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2365 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32984] An enzyme complex designated DICER COMPLEX, dices the GAM2365 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2365 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2365 RNA is designated SEQ ID:4956, and is provided hereinbelow with reference to the sequence listing part.

[32985] GAM2365 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2365 target RNA, herein designated GAM TARGET RNA. GAM2365 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32986] GAM2365 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2365 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2365 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2365 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2365 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32987] The complementary binding of GAM2365 RNA, herein designated GAM RNA, to target binding sites on GAM2365 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2365 target RNA, herein designated GAM TARGET RNA, into GAM2365 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[32988] It is appreciated that GAM2365 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2365 target genes. The mRNA of each one of this plurality of GAM2365 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2365 RNA, herein designated GAM RNA, and which when bound by GAM2365 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2365 target proteins.

[32989] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2365 gene, herein designated GAM GENE, on one or more GAM2365 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32990] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2365 correlate with, and may be deduced from, the identity of the target genes which GAM2365 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32991] Nucleotide sequences of the GAM2365 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2365 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2365 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2365 are further described hereinbelow with reference to Table 1.

[32992] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2365 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[32993] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2366 (GAM2366) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[32994] GAM2366 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2366 was detected is described hereinabove with reference to Figs. 2-8.

[32995] GAM2366 gene, herein designated GAM GENE, and GAM2366 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[32996] GAM2366 gene, herein designated GAM GENE, encodes a GAM2366 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2366 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2366 precursor RNA is designated SEQ ID:2343, and is provided hereinbelow with reference to the sequence listing part.

[32997] GAM2366 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32998] An enzyme complex designated DICER COMPLEX, dices the GAM2366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2366 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2366 RNA is designated SEQ ID:4957, and is provided hereinbelow with reference to the sequence listing part.

[32999] GAM2366 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2366 target RNA, herein designated GAM TARGET RNA. GAM2366 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33000] GAM2366 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2366 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2366 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2366 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2366 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33001] The complementary binding of GAM2366 RNA, herein designated GAM RNA, to target binding sites on GAM2366 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2366 target RNA, herein designated GAM TARGET RNA, into GAM2366 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33002] It is appreciated that GAM2366 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2366 target genes. The

mRNA of each one of this plurality of GAM2366 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2366 RNA, herein designated GAM RNA, and which when bound by GAM2366 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2366 target proteins.

[33003] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2366 gene, herein designated GAM GENE, on one or more GAM2366 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33004] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2366 correlate with, and may be deduced from, the identity of the target genes which GAM2366 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33005] Nucleotide sequences of the GAM2366 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2366 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2366 are further described hereinbelow with reference to Table 1.

[33006] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2366 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33007] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2367 (GAM2367) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33008] GAM2367 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2367 was detected is described hereinabove with reference to Figs. 2-8.

[33009] GAM2367 gene, herein designated GAM GENE, and GAM2367 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33010] GAM2367 gene, herein designated GAM GENE, encodes a GAM2367 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2367 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2367 precursor RNA is designated SEQ ID:2344, and is provided hereinbelow with reference to the sequence listing part.

[33011] GAM2367 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33012] An enzyme complex designated DICER COMPLEX, dices the GAM2367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2367 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2367 RNA is designated SEQ ID:4958, and is provided hereinbelow with reference to the sequence listing part.

[33013] GAM2367 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2367 target RNA, herein designated GAM TARGET RNA. GAM2367 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33014] GAM2367 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2367 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2367 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2367 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2367 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33015] The complementary binding of GAM2367 RNA, herein designated GAM RNA, to target binding sites on GAM2367 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2367 target RNA, herein designated GAM TARGET RNA, into GAM2367 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33016] It is appreciated that GAM2367 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2367 target genes. The mRNA of each one of this plurality of GAM2367 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2367 RNA, herein designated GAM RNA, and which when bound by GAM2367 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2367 target proteins.

[33017] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2367 gene, herein designated GAM GENE, on one or more GAM2367 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33018] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2367 correlate with, and may be deduced from, the identity of the target

genes which GAM2367 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33019] Nucleotide sequences of the GAM2367 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2367 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2367 are further described hereinbelow with reference to Table 1.

[33020] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2367 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33021] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2368 (GAM2368) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33022] GAM2368 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2368 was detected is described hereinabove with reference to Figs. 2-8.

[33023] GAM2368 gene, herein designated GAM GENE, and GAM2368 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

- [33024] GAM2368 gene, herein designated GAM GENE, encodes a GAM2368 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2368 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2368 precursor RNA is designated SEQ ID:2345, and is provided hereinbelow with reference to the sequence listing part.
- [33025] GAM2368 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [33026] An enzyme complex designated DICER COMPLEX, dices the GAM2368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2368 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2368 RNA is designated SEQ ID:4959, and is provided

hereinbelow with reference to the sequence listing part.

[33027] GAM2368 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2368 target RNA, herein designated GAM TARGET RNA. GAM2368 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33028] GAM2368 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2368 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2368 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2368 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2368 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33029] The complementary binding of GAM2368 RNA, herein designated GAM RNA, to target binding sites on GAM2368 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2368 target RNA, herein designated GAM TARGET RNA, into GAM2368 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33030] It is appreciated that GAM2368 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2368 target genes. The mRNA of each one of this plurality of GAM2368 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2368 RNA, herein designated GAM RNA, and which when bound by GAM2368 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2368 target proteins.

[33031] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2368 gene, herein designated GAM GENE, on one or more GAM2368 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33032] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2368 correlate with, and may be deduced from, the identity of the target genes which GAM2368 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33033] Nucleotide sequences of the GAM2368 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2368 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2368 are further described hereinbelow with reference to Table 1.

[33034] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2368 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33035] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2369 (GAM2369) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33036] GAM2369 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2369 was detected is described hereinabove with reference to Figs. 2-8.

[33037] GAM2369 gene, herein designated GAM GENE, and GAM2369 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33038] GAM2369 gene, herein designated GAM GENE, encodes a GAM2369 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2369 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2369 precursor RNA is designated SEQ ID:2346, and is provided hereinbelow with reference to the sequence listing part.

[33039] GAM2369 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33040] An enzyme complex designated DICER COMPLEX, dices the GAM2369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2369 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2369 RNA is designated SEQ ID:4960, and is provided hereinbelow with reference to the sequence listing part.

[33041] GAM2369 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2369 target RNA, herein designated GAM TARGET RNA. GAM2369 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33042] GAM2369 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2369 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2369 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2369 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2369 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33043] The complementary binding of GAM2369 RNA, herein designated GAM RNA, to target binding sites on GAM2369 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2369 target RNA, herein designated GAM TARGET RNA, into GAM2369 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33044] It is appreciated that GAM2369 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2369 target genes. The mRNA of each one of this plurality of GAM2369 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2369 RNA, herein designated GAM RNA, and which when bound by GAM2369 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2369 target proteins.

[33045] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2369 gene, herein designated GAM GENE, on one or more GAM2369 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33046] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2369 correlate with, and may be deduced from, the identity of the target genes which GAM2369 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33047] Nucleotide sequences of the GAM2369 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2369 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2369 are further described hereinbelow with reference to Table 1.

[33048] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2369 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33049] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2370 (GAM2370) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33050] GAM2370 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2370 was detected is described hereinabove with reference to Figs. 2-8.

[33051] GAM2370 gene, herein designated GAM GENE, and GAM2370 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33052] GAM2370 gene, herein designated GAM GENE, encodes a GAM2370 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2370 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2370 precursor RNA is designated SEQ ID:2347, and is provided hereinbelow with reference to the sequence listing part.

[33053] GAM2370 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [33054] An enzyme complex designated DICER COMPLEX, dices the GAM2370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2370 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM2370 RNA is designated SEQ ID:4961, and is provided hereinbelow with reference to the sequence listing part.
- [33055] GAM2370 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2370 target RNA, herein designated GAM TARGET RNA. GAM2370 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [33056] GAM2370 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2370 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2370 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2370 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2370 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33057] The complementary binding of GAM2370 RNA, herein designated GAM RNA, to target binding sites on GAM2370 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2370 target RNA, herein designated GAM TARGET RNA, into GAM2370 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33058] It is appreciated that GAM2370 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2370 target genes. The mRNA of each one of this plurality of GAM2370 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2370 RNA, herein designated GAM RNA, and which when bound by GAM2370 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2370 target proteins.

[33059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2370 gene, herein designated GAM GENE, on one or more GAM2370 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33060] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2370 correlate with, and may be deduced from, the identity of the target genes which GAM2370 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33061] Nucleotide sequences of the GAM2370 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2370 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2370 are further described hereinbelow with reference to Table 1.

[33062] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2370 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [33063] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2371 (GAM2371) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [33064] GAM2371 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2371 was detected is described hereinabove with reference to Figs. 2-8.
- [33065] GAM2371 gene, herein designated GAM GENE, and GAM2371 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [33066] GAM2371 gene, herein designated GAM GENE, encodes a GAM2371 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2371 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2371 precursor RNA is designated SEQ ID:2348, and is provided hereinbelow with reference to the sequence listing part.
- [33067] GAM2371 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33068] An enzyme complex designated DICER COMPLEX, dices the GAM2371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2371 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2371 RNA is designated SEQ ID:4963, and is provided hereinbelow with reference to the sequence listing part.

[33069] GAM2371 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2371 target RNA, herein designated GAM TARGET RNA. GAM2371 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33070] GAM2371 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2371 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2371 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2371 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2371 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33071] The complementary binding of GAM2371 RNA, herein designated GAM RNA, to target binding sites on GAM2371 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2371 target RNA, herein designated GAM TARGET RNA, into GAM2371 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33072] It is appreciated that GAM2371 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2371 target genes. The mRNA of each one of this plurality of GAM2371 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2371 RNA, herein designated GAM RNA, and which when bound by GAM2371 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2371 target proteins.

[33073] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2371 gene, herein designated GAM GENE, on one or more GAM2371 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33074] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2371 correlate with, and may be deduced from, the identity of the target genes which GAM2371 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33075] Nucleotide sequences of the GAM2371 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2371 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2371 are further described hereinbelow with reference to Table 1.

[33076] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2371 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33077] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2372 (GAM2372) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33078] GAM2372 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2372 was detected is described hereinabove with reference to Figs. 2-8.

[33079] GAM2372 gene, herein designated GAM GENE, and GAM2372 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33080] GAM2372 gene, herein designated GAM GENE, encodes a GAM2372 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2372 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2372 precursor RNA is designated SEQ ID:2349, and is provided hereinbelow with reference to the sequence listing part.

[33081] GAM2372 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33082] An enzyme complex designated DICER COMPLEX, dices the GAM2372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2372 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2372 RNA is designated SEQ ID:4962, and is provided hereinbelow with reference to the sequence listing part.

[33083] GAM2372 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2372 target RNA, herein designated GAM TARGET RNA. GAM2372 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33084] GAM2372 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2372 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2372 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2372 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2372 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33085] The complementary binding of GAM2372 RNA, herein designated GAM RNA, to target binding sites on GAM2372 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2372 target RNA, herein designated GAM TARGET RNA, into GAM2372 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33086] It is appreciated that GAM2372 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2372 target genes. The

mRNA of each one of this plurality of GAM2372 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2372 RNA, herein designated GAM RNA, and which when bound by GAM2372 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2372 target proteins.

[33087] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2372 gene, herein designated GAM GENE, on one or more GAM2372 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33088] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2372 correlate with, and may be deduced from, the identity of the target genes which GAM2372 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33089] Nucleotide sequences of the GAM2372 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2372 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2372 are further described hereinbelow with reference to Table 1.

[33090] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2372 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33091] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2373 (GAM2373) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33092] GAM2373 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2373 was detected is described hereinabove with reference to Figs. 2-8.

[33093] GAM2373 gene, herein designated GAM GENE, and GAM2373 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33094] GAM2373 gene, herein designated GAM GENE, encodes a GAM2373 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2373 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2373 precursor RNA is designated SEQ ID:2350, and is provided hereinbelow with reference to the sequence listing part.

[33095] GAM2373 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33096] An enzyme complex designated DICER COMPLEX, dices the GAM2373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2373 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2373 RNA is designated SEQ ID:4964, and is provided hereinbelow with reference to the sequence listing part.

[33097] GAM2373 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2373 target RNA, herein designated GAM TARGET RNA. GAM2373 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33098] GAM2373 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2373 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2373 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2373 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2373 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33099] The complementary binding of GAM2373 RNA, herein designated GAM RNA, to target binding sites on GAM2373 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2373 target RNA, herein designated GAM TARGET RNA, into GAM2373 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33100] It is appreciated that GAM2373 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2373 target genes. The mRNA of each one of this plurality of GAM2373 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2373 RNA, herein designated GAM RNA, and which when bound by GAM2373 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2373 target proteins.

[33101] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2373 gene, herein designated GAM GENE, on one or more GAM2373 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33102] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2373 correlate with, and may be deduced from, the identity of the target

genes which GAM2373 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33103] Nucleotide sequences of the GAM2373 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2373 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2373 are further described hereinbelow with reference to Table 1.

[33104] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2373 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33105] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2374 (GAM2374) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33106] GAM2374 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2374 was detected is described hereinabove with reference to Figs. 2-8.

[33107] GAM2374 gene, herein designated GAM GENE, and GAM2374 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

- [33108] GAM2374 gene, herein designated GAM GENE, encodes a GAM2374 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2374 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2374 precursor RNA is designated SEQ ID:2351, and is provided hereinbelow with reference to the sequence listing part.
- [33109] GAM2374 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [33110] An enzyme complex designated DICER COMPLEX, dices the GAM2374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2374 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2374 RNA is designated SEQ ID:4965, and is provided

hereinbelow with reference to the sequence listing part.

[33111] GAM2374 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2374 target RNA, herein designated GAM TARGET RNA. GAM2374 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33112] GAM2374 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2374 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2374 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2374 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2374 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33113] The complementary binding of GAM2374 RNA, herein designated GAM RNA, to target binding sites on GAM2374 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2374 target RNA, herein designated GAM TARGET RNA, into GAM2374 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33114] It is appreciated that GAM2374 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2374 target genes. The mRNA of each one of this plurality of GAM2374 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2374 RNA, herein designated GAM RNA, and which when bound by GAM2374 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2374 target proteins.

[33115] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2374 gene, herein designated GAM GENE, on one or more GAM2374 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33116] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2374 correlate with, and may be deduced from, the identity of the target genes which GAM2374 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33117] Nucleotide sequences of the GAM2374 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2374 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2374 are further described hereinbelow with reference to Table 1.

[33118] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2374 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33119] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2375 (GAM2375) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33120] GAM2375 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2375 was detected is described hereinabove with reference to Figs. 2-8.

[33121] GAM2375 gene, herein designated GAM GENE, and GAM2375 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33122] GAM2375 gene, herein designated GAM GENE, encodes a GAM2375 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2375 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2375 precursor RNA is designated SEQ ID:2352, and is provided hereinbelow with reference to the sequence listing part.

[33123] GAM2375 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33124] An enzyme complex designated DICER COMPLEX, dices the GAM2375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2375 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2375 RNA is designated SEQ ID:4966, and is provided hereinbelow with reference to the sequence listing part.

[33125] GAM2375 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2375 target RNA, herein designated GAM TARGET RNA. GAM2375 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33126] GAM2375 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2375 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2375 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2375 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2375 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33127] The complementary binding of GAM2375 RNA, herein designated GAM RNA, to target binding sites on GAM2375 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2375 target RNA, herein designated GAM TARGET RNA, into GAM2375 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33128] It is appreciated that GAM2375 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2375 target genes. The mRNA of each one of this plurality of GAM2375 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2375 RNA, herein designated GAM RNA, and which when bound by GAM2375 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2375 target proteins.

[33129] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2375 gene, herein designated GAM GENE, on one or more GAM2375 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33130] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2375 correlate with, and may be deduced from, the identity of the target genes which GAM2375 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33131] Nucleotide sequences of the GAM2375 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2375 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2375 are further described hereinbelow with reference to Table 1.

[33132] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2375 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33133] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2376 (GAM2376) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [33134] GAM2376 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2376 was detected is described hereinabove with reference to Figs. 2-8.
- [33135] GAM2376 gene, herein designated GAM GENE, and GAM2376 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [33136] GAM2376 gene, herein designated GAM GENE, encodes a GAM2376 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2376 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2376 precursor RNA is designated SEQ ID:2353, and is provided hereinbelow with reference to the sequence listing part.
- [33137] GAM2376 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [33138] An enzyme complex designated DICER COMPLEX, dices the GAM2376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2376 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2376 RNA is designated SEQ ID:4967, and is provided hereinbelow with reference to the sequence listing part.
- [33139] GAM2376 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2376 target RNA, herein designated GAM TARGET RNA. GAM2376 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [33140] GAM2376 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2376 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2376 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2376 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2376 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33141] The complementary binding of GAM2376 RNA, herein designated GAM RNA, to target binding sites on GAM2376 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2376 target RNA, herein designated GAM TARGET RNA, into GAM2376 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33142] It is appreciated that GAM2376 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2376 target genes. The mRNA of each one of this plurality of GAM2376 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2376 RNA, herein designated GAM RNA, and which when bound by GAM2376 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2376 target proteins.

[33143] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2376 gene, herein designated GAM GENE, on one or more GAM2376 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33144] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2376 correlate with, and may be deduced from, the identity of the target genes which GAM2376 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33145] Nucleotide sequences of the GAM2376 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2376 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2376 are further described hereinbelow with reference to Table 1.

[33146] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2376 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [33147] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2377 (GAM2377) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [33148] GAM2377 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2377 was detected is described hereinabove with reference to Figs. 2-8.
- [33149] GAM2377 gene, herein designated GAM GENE, and GAM2377 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [33150] GAM2377 gene, herein designated GAM GENE, encodes a GAM2377 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2377 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2377 precursor RNA is designated SEQ ID:2354, and is provided hereinbelow with reference to the sequence listing part.
- [33151] GAM2377 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33152] An enzyme complex designated DICER COMPLEX, dices the GAM2377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2377 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2377 RNA is designated SEQ ID:4968, and is provided hereinbelow with reference to the sequence listing part.

[33153] GAM2377 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2377 target RNA, herein designated GAM TARGET RNA. GAM2377 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33154] GAM2377 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2377 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2377 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2377 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2377 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33155] The complementary binding of GAM2377 RNA, herein designated GAM RNA, to target binding sites on GAM2377 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2377 target RNA, herein designated GAM TARGET RNA, into GAM2377 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33156] It is appreciated that GAM2377 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2377 target genes. The mRNA of each one of this plurality of GAM2377 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2377 RNA, herein designated GAM RNA, and which when bound by GAM2377 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2377 target proteins.

[33157] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2377 gene, herein designated GAM GENE, on one or more GAM2377 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33158] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2377 correlate with, and may be deduced from, the identity of the target genes which GAM2377 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33159] Nucleotide sequences of the GAM2377 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2377 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2377 are further described hereinbelow with reference to Table 1.

[33160] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2377 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33161] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2378 (GAM2378) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33162] GAM2378 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2378 was detected is described hereinabove with reference to Figs. 2-8.

[33163] GAM2378 gene, herein designated GAM GENE, and GAM2378 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33164] GAM2378 gene, herein designated GAM GENE, encodes a GAM2378 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2378 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2378 precursor RNA is designated SEQ ID:2355, and is provided hereinbelow with reference to the sequence listing part.

[33165] GAM2378 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33166] An enzyme complex designated DICER COMPLEX, dices the GAM2378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2378 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2378 RNA is designated SEQ ID:4969, and is provided hereinbelow with reference to the sequence listing part.

[33167] GAM2378 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2378 target RNA, herein designated GAM TARGET RNA. GAM2378 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33168] GAM2378 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2378 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2378 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2378 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2378 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33169] The complementary binding of GAM2378 RNA, herein designated GAM RNA, to target binding sites on GAM2378 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2378 target RNA, herein designated GAM TARGET RNA, into GAM2378 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33170] It is appreciated that GAM2378 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2378 target genes. The

mRNA of each one of this plurality of GAM2378 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2378 RNA, herein designated GAM RNA, and which when bound by GAM2378 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2378 target proteins.

[33171] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2378 gene, herein designated GAM GENE, on one or more GAM2378 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33172] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2378 correlate with, and may be deduced from, the identity of the target genes which GAM2378 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33173] Nucleotide sequences of the GAM2378 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2378 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2378 are further described hereinbelow with reference to Table 1.

[33174] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2378 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33175] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2379 (GAM2379) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33176] GAM2379 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2379 was detected is described hereinabove with reference to Figs. 2-8.

[33177] GAM2379 gene, herein designated GAM GENE, and GAM2379 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33178] GAM2379 gene, herein designated GAM GENE, encodes a GAM2379 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2379 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2379 precursor RNA is designated SEQ ID:2356, and is provided hereinbelow with reference to the sequence listing part.

[33179] GAM2379 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33180] An enzyme complex designated DICER COMPLEX, dices the GAM2379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2379 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2379 RNA is designated SEQ ID:4970, and is provided hereinbelow with reference to the sequence listing part.

[33181] GAM2379 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2379 target RNA, herein designated GAM TARGET RNA. GAM2379 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33182] GAM2379 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2379 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2379 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2379 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2379 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33183] The complementary binding of GAM2379 RNA, herein designated GAM RNA, to target binding sites on GAM2379 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2379 target RNA, herein designated GAM TARGET RNA, into GAM2379 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33184] It is appreciated that GAM2379 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2379 target genes. The mRNA of each one of this plurality of GAM2379 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2379 RNA, herein designated GAM RNA, and which when bound by GAM2379 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2379 target proteins.

[33185] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2379 gene, herein designated GAM GENE, on one or more GAM2379 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33186] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2379 correlate with, and may be deduced from, the identity of the target

genes which GAM2379 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33187] Nucleotide sequences of the GAM2379 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2379 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2379 are further described hereinbelow with reference to Table 1.

[33188] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2379 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33189] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2380 (GAM2380) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33190] GAM2380 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2380 was detected is described hereinabove with reference to Figs. 2-8.

[33191] GAM2380 gene, herein designated GAM GENE, and GAM2380 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

- [33192] GAM2380 gene, herein designated GAM GENE, encodes a GAM2380 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2380 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2380 precursor RNA is designated SEQ ID:2357, and is provided hereinbelow with reference to the sequence listing part.
- [33193] GAM2380 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [33194] An enzyme complex designated DICER COMPLEX, dices the GAM2380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2380 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2380 RNA is designated SEQ ID:4971, and is provided

hereinbelow with reference to the sequence listing part.

[33195] GAM2380 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2380 target RNA, herein designated GAM TARGET RNA. GAM2380 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33196] GAM2380 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2380 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2380 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2380 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2380 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33197] The complementary binding of GAM2380 RNA, herein designated GAM RNA, to target binding sites on GAM2380 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2380 target RNA, herein designated GAM TARGET RNA, into GAM2380 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33198] It is appreciated that GAM2380 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2380 target genes. The mRNA of each one of this plurality of GAM2380 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2380 RNA, herein designated GAM RNA, and which when bound by GAM2380 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2380 target proteins.

[33199] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2380 gene, herein designated GAM GENE, on one or more GAM2380 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33200] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2380 correlate with, and may be deduced from, the identity of the target genes which GAM2380 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33201] Nucleotide sequences of the GAM2380 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2380 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2380 are further described hereinbelow with reference to Table 1.

[33202] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2380 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33203] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2381 (GAM2381) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33204] GAM2381 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2381 was detected is described hereinabove with reference to Figs. 2-8.

[33205] GAM2381 gene, herein designated GAM GENE, and GAM2381 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33206] GAM2381 gene, herein designated GAM GENE, encodes a GAM2381 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2381 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2381 precursor RNA is designated SEQ ID:2358, and is provided hereinbelow with reference to the sequence listing part.

[33207] GAM2381 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33208] An enzyme complex designated DICER COMPLEX, dices the GAM2381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2381 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2381 RNA is designated SEQ ID:4972, and is provided hereinbelow with reference to the sequence listing part.

[33209] GAM2381 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2381 target RNA, herein designated GAM TARGET RNA. GAM2381 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33210] GAM2381 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2381 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2381 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2381 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2381 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33211] The complementary binding of GAM2381 RNA, herein designated GAM RNA, to target binding sites on GAM2381 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2381 target RNA, herein designated GAM TARGET RNA, into GAM2381 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33212] It is appreciated that GAM2381 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2381 target genes. The mRNA of each one of this plurality of GAM2381 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2381 RNA, herein designated GAM RNA, and which when bound by GAM2381 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2381 target proteins.

[33213] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2381 gene, herein designated GAM GENE, on one or more GAM2381 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33214] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2381 correlate with, and may be deduced from, the identity of the target genes which GAM2381 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33215] Nucleotide sequences of the GAM2381 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2381 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2381 are further described hereinbelow with reference to Table 1.

[33216] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2381 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33217] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2382 (GAM2382) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [33218] GAM2382 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2382 was detected is described hereinabove with reference to Figs. 2-8.
- [33219] GAM2382 gene, herein designated GAM GENE, and GAM2382 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [33220] GAM2382 gene, herein designated GAM GENE, encodes a GAM2382 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2382 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2382 precursor RNA is designated SEQ ID:2359, and is provided hereinbelow with reference to the sequence listing part.
- [33221] GAM2382 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [33222] An enzyme complex designated DICER COMPLEX, dices the GAM2382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2382 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2382 RNA is designated SEQ ID:4973, and is provided hereinbelow with reference to the sequence listing part.
- [33223] GAM2382 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2382 target RNA, herein designated GAM TARGET RNA. GAM2382 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [33224] GAM2382 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2382 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2382 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2382 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2382 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33225] The complementary binding of GAM2382 RNA, herein designated GAM RNA, to target binding sites on GAM2382 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2382 target RNA, herein designated GAM TARGET RNA, into GAM2382 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33226] It is appreciated that GAM2382 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2382 target genes. The mRNA of each one of this plurality of GAM2382 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2382 RNA, herein designated GAM RNA, and which when bound by GAM2382 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2382 target proteins.

[33227] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2382 gene, herein designated GAM GENE, on one or more GAM2382 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33228] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2382 correlate with, and may be deduced from, the identity of the target genes which GAM2382 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33229] Nucleotide sequences of the GAM2382 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2382 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2382 are further described hereinbelow with reference to Table 1.

[33230] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2382 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[33231] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2383 (GAM2383) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33232] GAM2383 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2383 was detected is described hereinabove with reference to Figs. 2-8.

[33233] GAM2383 gene, herein designated GAM GENE, and GAM2383 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33234] GAM2383 gene, herein designated GAM GENE, encodes a GAM2383 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2383 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2383 precursor RNA is designated SEQ ID:2360, and is provided hereinbelow with reference to the sequence listing part.

[33235] GAM2383 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33236] An enzyme complex designated DICER COMPLEX, dices the GAM2383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2383 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2383 RNA is designated SEQ ID:4974, and is provided hereinbelow with reference to the sequence listing part.

[33237] GAM2383 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2383 target RNA, herein designated GAM TARGET RNA. GAM2383 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33238] GAM2383 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2383 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2383 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2383 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2383 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33239] The complementary binding of GAM2383 RNA, herein designated GAM RNA, to target binding sites on GAM2383 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2383 target RNA, herein designated GAM TARGET RNA, into GAM2383 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33240] It is appreciated that GAM2383 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2383 target genes. The mRNA of each one of this plurality of GAM2383 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2383 RNA, herein designated GAM RNA, and which when bound by GAM2383 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2383 target proteins.

[33241] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2383 gene, herein designated GAM GENE, on one or more GAM2383 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33242] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2383 correlate with, and may be deduced from, the identity of the target genes which GAM2383 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33243] Nucleotide sequences of the GAM2383 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2383 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2383 are further described hereinbelow with reference to Table 1.

[33244] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2383 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33245] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2384 (GAM2384) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33246] GAM2384 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2384 was detected is described hereinabove with reference to Figs. 2-8.

[33247] GAM2384 gene, herein designated GAM GENE, and GAM2384 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33248] GAM2384 gene, herein designated GAM GENE, encodes a GAM2384 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2384 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2384 precursor RNA is designated SEQ ID:2361, and is provided hereinbelow with reference to the sequence listing part.

[33249] GAM2384 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33250] An enzyme complex designated DICER COMPLEX, dices the GAM2384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2384 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2384 RNA is designated SEQ ID:4975, and is provided hereinbelow with reference to the sequence listing part.

[33251] GAM2384 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2384 target RNA, herein designated GAM TARGET RNA. GAM2384 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33252] GAM2384 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2384 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2384 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2384 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2384 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33253] The complementary binding of GAM2384 RNA, herein designated GAM RNA, to target binding sites on GAM2384 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2384 target RNA, herein designated GAM TARGET RNA, into GAM2384 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33254] It is appreciated that GAM2384 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2384 target genes. The

mRNA of each one of this plurality of GAM2384 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2384 RNA, herein designated GAM RNA, and which when bound by GAM2384 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2384 target proteins.

[33255] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2384 gene, herein designated GAM GENE, on one or more GAM2384 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33256] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2384 correlate with, and may be deduced from, the identity of the target genes which GAM2384 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33257] Nucleotide sequences of the GAM2384 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2384 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2384 are further described hereinbelow with reference to Table 1.

[33258] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2384 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33259] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2385 (GAM2385) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33260] GAM2385 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2385 was detected is described hereinabove with reference to Figs. 2-8.

[33261] GAM2385 gene, herein designated GAM GENE, and GAM2385 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33262] GAM2385 gene, herein designated GAM GENE, encodes a GAM2385 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2385 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2385 precursor RNA is designated SEQ ID:2362, and is provided hereinbelow with reference to the sequence listing part.

[33263] GAM2385 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33264] An enzyme complex designated DICER COMPLEX, dices the GAM2385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2385 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2385 RNA is designated SEQ ID:4976, and is provided hereinbelow with reference to the sequence listing part.

[33265] GAM2385 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2385 target RNA, herein designated GAM TARGET RNA. GAM2385 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33266] GAM2385 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2385 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2385 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2385 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2385 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33267] The complementary binding of GAM2385 RNA, herein designated GAM RNA, to target binding sites on GAM2385 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2385 target RNA, herein designated GAM TARGET RNA, into GAM2385 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33268] It is appreciated that GAM2385 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2385 target genes. The mRNA of each one of this plurality of GAM2385 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2385 RNA, herein designated GAM RNA, and which when bound by GAM2385 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2385 target proteins.

[33269] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2385 gene, herein designated GAM GENE, on one or more GAM2385 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33270] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2385 correlate with, and may be deduced from, the identity of the target

genes which GAM2385 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33271] Nucleotide sequences of the GAM2385 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2385 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2385 are further described hereinbelow with reference to Table 1.

[33272] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2385 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33273] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2386 (GAM2386) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33274] GAM2386 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2386 was detected is described hereinabove with reference to Figs. 2-8.

[33275] GAM2386 gene, herein designated GAM GENE, and GAM2386 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[33276] GAM2386 gene, herein designated GAM GENE, encodes a GAM2386 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2386 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2386 precursor RNA is designated SEQ ID:2363, and is provided hereinbelow with reference to the sequence listing part.

[33277] GAM2386 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33278] An enzyme complex designated DICER COMPLEX, dices the GAM2386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2386 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2386 RNA is designated SEQ ID:4977, and is provided

hereinbelow with reference to the sequence listing part.

[33279] GAM2386 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2386 target RNA, herein designated GAM TARGET RNA. GAM2386 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33280] GAM2386 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2386 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2386 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2386 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2386 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33281] The complementary binding of GAM2386 RNA, herein designated GAM RNA, to target binding sites on GAM2386 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2386 target RNA, herein designated GAM TARGET RNA, into GAM2386 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33282] It is appreciated that GAM2386 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2386 target genes. The mRNA of each one of this plurality of GAM2386 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2386 RNA, herein designated GAM RNA, and which when bound by GAM2386 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2386 target proteins.

[33283] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2386 gene, herein designated GAM GENE, on one or more GAM2386 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33284] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2386 correlate with, and may be deduced from, the identity of the target genes which GAM2386 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33285] Nucleotide sequences of the GAM2386 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2386 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2386 are further described hereinbelow with reference to Table 1.

[33286] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2386 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33287] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2387 (GAM2387) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33288] GAM2387 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2387 was detected is described hereinabove with reference to Figs. 2-8.

[33289] GAM2387 gene, herein designated GAM GENE, and GAM2387 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33290] GAM2387 gene, herein designated GAM GENE, encodes a GAM2387 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2387 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2387 precursor RNA is designated SEQ ID:2364, and is provided hereinbelow with reference to the sequence listing part.

[33291] GAM2387 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33292] An enzyme complex designated DICER COMPLEX, dices the GAM2387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2387 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2387 RNA is designated SEQ ID:4978, and is provided hereinbelow with reference to the sequence listing part.

[33293] GAM2387 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2387 target RNA, herein designated GAM TARGET RNA. GAM2387 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33294] GAM2387 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2387 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2387 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2387 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2387 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33295] The complementary binding of GAM2387 RNA, herein designated GAM RNA, to target binding sites on GAM2387 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2387 target RNA, herein designated GAM TARGET RNA, into GAM2387 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33296] It is appreciated that GAM2387 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2387 target genes. The mRNA of each one of this plurality of GAM2387 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2387 RNA, herein designated GAM RNA, and which when bound by GAM2387 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2387 target proteins.

[33297] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2387 gene, herein designated GAM GENE, on one or more GAM2387 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33298] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2387 correlate with, and may be deduced from, the identity of the target genes which GAM2387 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33299] Nucleotide sequences of the GAM2387 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2387 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2387 are further described hereinbelow with reference to Table 1.

[33300] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2387 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33301] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2388 (GAM2388) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [33302] GAM2388 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2388 was detected is described hereinabove with reference to Figs. 2-8.
- [33303] GAM2388 gene, herein designated GAM GENE, and GAM2388 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [33304] GAM2388 gene, herein designated GAM GENE, encodes a GAM2388 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2388 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2388 precursor RNA is designated SEQ ID:2365, and is provided hereinbelow with reference to the sequence listing part.
- [33305] GAM2388 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [33306] An enzyme complex designated DICER COMPLEX, dices the GAM2388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2388 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2388 RNA is designated SEQ ID:4979, and is provided hereinbelow with reference to the sequence listing part.
- [33307] GAM2388 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2388 target RNA, herein designated GAM TARGET RNA. GAM2388 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [33308] GAM2388 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2388 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2388 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2388 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2388 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33309] The complementary binding of GAM2388 RNA, herein designated GAM RNA, to target binding sites on GAM2388 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2388 target RNA, herein designated GAM TARGET RNA, into GAM2388 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33310] It is appreciated that GAM2388 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2388 target genes. The mRNA of each one of this plurality of GAM2388 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2388 RNA, herein designated GAM RNA, and which when bound by GAM2388 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2388 target proteins.

[33311] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2388 gene, herein designated GAM GENE, on one or more GAM2388 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33312] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2388 correlate with, and may be deduced from, the identity of the target genes which GAM2388 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33313] Nucleotide sequences of the GAM2388 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2388 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2388 are further described hereinbelow with reference to Table 1.

[33314] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2388 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [33315] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2389 (GAM2389) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [33316] GAM2389 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2389 was detected is described hereinabove with reference to Figs. 2-8.
- [33317] GAM2389 gene, herein designated GAM GENE, and GAM2389 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [33318] GAM2389 gene, herein designated GAM GENE, encodes a GAM2389 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2389 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2389 precursor RNA is designated SEQ ID:2366, and is provided hereinbelow with reference to the sequence listing part.
- [33319] GAM2389 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33320] An enzyme complex designated DICER COMPLEX, dices the GAM2389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2389 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2389 RNA is designated SEQ ID:4980, and is provided hereinbelow with reference to the sequence listing part.

[33321] GAM2389 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2389 target RNA, herein designated GAM TARGET RNA. GAM2389 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33322] GAM2389 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2389 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2389 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2389 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2389 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33323] The complementary binding of GAM2389 RNA, herein designated GAM RNA, to target binding sites on GAM2389 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2389 target RNA, herein designated GAM TARGET RNA, into GAM2389 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33324] It is appreciated that GAM2389 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2389 target genes. The mRNA of each one of this plurality of GAM2389 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2389 RNA, herein designated GAM RNA, and which when bound by GAM2389 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2389 target proteins.

[33325] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2389 gene, herein designated GAM GENE, on one or more GAM2389 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33326] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2389 correlate with, and may be deduced from, the identity of the target genes which GAM2389 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33327] Nucleotide sequences of the GAM2389 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2389 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2389 are further described hereinbelow with reference to Table 1.

[33328] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2389 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33329] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2390 (GAM2390) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33330] GAM2390 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2390 was detected is described hereinabove with reference to Figs. 2-8.

[33331] GAM2390 gene, herein designated GAM GENE, and GAM2390 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33332] GAM2390 gene, herein designated GAM GENE, encodes a GAM2390 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2390 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2390 precursor RNA is designated SEQ ID:2367, and is provided hereinbelow with reference to the sequence listing part.

[33333] GAM2390 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33334] An enzyme complex designated DICER COMPLEX, dices the GAM2390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2390 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM2390 RNA is designated SEQ ID:4981, and is provided hereinbelow with reference to the sequence listing part.

[33335] GAM2390 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2390 target RNA, herein designated GAM TARGET RNA. GAM2390 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33336] GAM2390 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2390 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2390 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2390 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2390 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33337] The complementary binding of GAM2390 RNA, herein designated GAM RNA, to target binding sites on GAM2390 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2390 target RNA, herein designated GAM TARGET RNA, into GAM2390 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33338] It is appreciated that GAM2390 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2390 target genes. The

mRNA of each one of this plurality of GAM2390 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2390 RNA, herein designated GAM RNA, and which when bound by GAM2390 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2390 target proteins.

[33339] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2390 gene, herein designated GAM GENE, on one or more GAM2390 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33340] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2390 correlate with, and may be deduced from, the identity of the target genes which GAM2390 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33341] Nucleotide sequences of the GAM2390 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2390 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2390 are further described hereinbelow with reference to Table 1.

[33342] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2390 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33343] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2391 (GAM2391) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33344] GAM2391 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2391 was detected is described hereinabove with reference to Figs. 2-8.

[33345] GAM2391 gene, herein designated GAM GENE, and GAM2391 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33346] GAM2391 gene, herein designated GAM GENE, encodes a GAM2391 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2391 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2391 precursor RNA is designated SEQ ID:2368, and is provided hereinbelow with reference to the sequence listing part.

[33347] GAM2391 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33348] An enzyme complex designated DICER COMPLEX, dices the GAM2391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2391 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2391 RNA is designated SEQ ID:4982, and is provided hereinbelow with reference to the sequence listing part.

[33349] GAM2391 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2391 target RNA, herein designated GAM TARGET RNA. GAM2391 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33350] GAM2391 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2391 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2391 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2391 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2391 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33351] The complementary binding of GAM2391 RNA, herein designated GAM RNA, to target binding sites on GAM2391 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2391 target RNA, herein designated GAM TARGET RNA, into GAM2391 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33352] It is appreciated that GAM2391 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2391 target genes. The mRNA of each one of this plurality of GAM2391 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2391 RNA, herein designated GAM RNA, and which when bound by GAM2391 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2391 target proteins.

[33353] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2391 gene, herein designated GAM GENE, on one or more GAM2391 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33354] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2391 correlate with, and may be deduced from, the identity of the target

genes which GAM2391 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33355] Nucleotide sequences of the GAM2391 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2391 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2391 are further described hereinbelow with reference to Table 1.

[33356] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2391 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33357] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2392 (GAM2392) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33358] GAM2392 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2392 was detected is described hereinabove with reference to Figs. 2-8.

[33359] GAM2392 gene, herein designated GAM GENE, and GAM2392 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[33360] GAM2392 gene, herein designated GAM GENE, encodes a GAM2392 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2392 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2392 precursor RNA is designated SEQ ID:2369, and is provided hereinbelow with reference to the sequence listing part.

[33361] GAM2392 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2392 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33362] An enzyme complex designated DICER COMPLEX, dices the GAM2392 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2392 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2392 RNA is designated SEQ ID:4983, and is provided

hereinbelow with reference to the sequence listing part.

[33363] GAM2392 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2392 target RNA, herein designated GAM TARGET RNA. GAM2392 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33364] GAM2392 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2392 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2392 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2392 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2392 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33365] The complementary binding of GAM2392 RNA, herein designated GAM RNA, to target binding sites on GAM2392 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2392 target RNA, herein designated GAM TARGET RNA, into GAM2392 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33366] It is appreciated that GAM2392 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2392 target genes. The mRNA of each one of this plurality of GAM2392 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2392 RNA, herein designated GAM RNA, and which when bound by GAM2392 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2392 target proteins.

[33367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2392 gene, herein designated GAM GENE, on one or more GAM2392 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33368] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2392 correlate with, and may be deduced from, the identity of the target genes which GAM2392 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33369] Nucleotide sequences of the GAM2392 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2392 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2392 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2392 are further described hereinbelow with reference to Table 1.

[33370] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2392 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33371] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2393 (GAM2393) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33372] GAM2393 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2393 was detected is described hereinabove with reference to Figs. 2-8.

[33373] GAM2393 gene, herein designated GAM GENE, and GAM2393 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33374] GAM2393 gene, herein designated GAM GENE, encodes a GAM2393 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2393 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2393 precursor RNA is designated SEQ ID:2370, and is provided hereinbelow with reference to the sequence listing part.

[33375] GAM2393 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33376] An enzyme complex designated DICER COMPLEX, dices the GAM2393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2393 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2393 RNA is designated SEQ ID:4985, and is provided hereinbelow with reference to the sequence listing part.

[33377] GAM2393 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2393 target RNA, herein designated GAM TARGET RNA. GAM2393 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33378] GAM2393 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2393 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2393 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2393 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2393 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33379] The complementary binding of GAM2393 RNA, herein designated GAM RNA, to target binding sites on GAM2393 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2393 target RNA, herein designated GAM TARGET RNA, into GAM2393 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33380] It is appreciated that GAM2393 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2393 target genes. The mRNA of each one of this plurality of GAM2393 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2393 RNA, herein designated GAM RNA, and which when bound by GAM2393 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2393 target proteins.

[33381] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2393 gene, herein designated GAM GENE, on one or more GAM2393 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33382] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2393 correlate with, and may be deduced from, the identity of the target genes which GAM2393 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33383] Nucleotide sequences of the GAM2393 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2393 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2393 are further described hereinbelow with reference to Table 1.

[33384] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2393 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33385] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2394 (GAM2394) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33386] GAM2394 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2394 was detected is described hereinabove with reference to Figs. 2-8.

[33387] GAM2394 gene, herein designated GAM GENE, and GAM2394 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33388] GAM2394 gene, herein designated GAM GENE, encodes a GAM2394 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2394 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2394 precursor RNA is designated SEQ ID:2371, and is provided hereinbelow with reference to the sequence listing part.

[33389] GAM2394 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33390] An enzyme complex designated DICER COMPLEX, dices the GAM2394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2394 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2394 RNA is designated SEQ ID:4984, and is provided hereinbelow with reference to the sequence listing part.

[33391] GAM2394 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2394 target RNA, herein designated GAM TARGET RNA. GAM2394 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33392] GAM2394 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2394 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2394 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2394 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2394 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33393] The complementary binding of GAM2394 RNA, herein designated GAM RNA, to target binding sites on GAM2394 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2394 target RNA, herein designated GAM TARGET RNA, into GAM2394 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33394] It is appreciated that GAM2394 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2394 target genes. The mRNA of each one of this plurality of GAM2394 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2394 RNA, herein designated GAM RNA, and which when bound by GAM2394 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2394 target proteins.

[33395] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2394 gene, herein designated GAM GENE, on one or more GAM2394 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33396] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2394 correlate with, and may be deduced from, the identity of the target genes which GAM2394 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33397] Nucleotide sequences of the GAM2394 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2394 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2394 are further described hereinbelow with reference to Table 1.

[33398] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2394 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[33399] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2395 (GAM2395) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33400] GAM2395 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2395 was detected is described hereinabove with reference to Figs. 2-8.

[33401] GAM2395 gene, herein designated GAM GENE, and GAM2395 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33402] GAM2395 gene, herein designated GAM GENE, encodes a GAM2395 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2395 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2395 precursor RNA is designated SEQ ID:2372, and is provided hereinbelow with reference to the sequence listing part.

[33403] GAM2395 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33404] An enzyme complex designated DICER COMPLEX, dices the GAM2395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2395 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2395 RNA is designated SEQ ID:4986, and is provided hereinbelow with reference to the sequence listing part.

[33405] GAM2395 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2395 target RNA, herein designated GAM TARGET RNA. GAM2395 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33406] GAM2395 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2395 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2395 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2395 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2395 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33407] The complementary binding of GAM2395 RNA, herein designated GAM RNA, to target binding sites on GAM2395 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2395 target RNA, herein designated GAM TARGET RNA, into GAM2395 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33408] It is appreciated that GAM2395 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2395 target genes. The mRNA of each one of this plurality of GAM2395 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2395 RNA, herein designated GAM RNA, and which when bound by GAM2395 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2395 target proteins.

[33409] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2395 gene, herein designated GAM GENE, on one or more GAM2395 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33410] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2395 correlate with, and may be deduced from, the identity of the target genes which GAM2395 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33411] Nucleotide sequences of the GAM2395 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2395 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2395 are further described hereinbelow with reference to Table 1.

[33412] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2395 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33413] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2396 (GAM2396) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33414] GAM2396 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2396 was detected is described hereinabove with reference to Figs. 2-8.

[33415] GAM2396 gene, herein designated GAM GENE, and GAM2396 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33416] GAM2396 gene, herein designated GAM GENE, encodes a GAM2396 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2396 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2396 precursor RNA is designated SEQ ID:2373, and is provided hereinbelow with reference to the sequence listing part.

[33417] GAM2396 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33418] An enzyme complex designated DICER COMPLEX, dices the GAM2396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2396 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2396 RNA is designated SEQ ID:4987, and is provided hereinbelow with reference to the sequence listing part.

[33419] GAM2396 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2396 target RNA, herein designated GAM TARGET RNA. GAM2396 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33420] GAM2396 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2396 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2396 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2396 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2396 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33421] The complementary binding of GAM2396 RNA, herein designated GAM RNA, to target binding sites on GAM2396 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2396 target RNA, herein designated GAM TARGET RNA, into GAM2396 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33422] It is appreciated that GAM2396 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2396 target genes. The

mRNA of each one of this plurality of GAM2396 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2396 RNA, herein designated GAM RNA, and which when bound by GAM2396 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2396 target proteins.

[33423] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2396 gene, herein designated GAM GENE, on one or more GAM2396 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33424] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2396 correlate with, and may be deduced from, the identity of the target genes which GAM2396 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33425] Nucleotide sequences of the GAM2396 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2396 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2396 are further described hereinbelow with reference to Table 1.

[33426] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2396 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33427] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2397 (GAM2397) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33428] GAM2397 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2397 was detected is described hereinabove with reference to Figs. 2-8.

[33429] GAM2397 gene, herein designated GAM GENE, and GAM2397 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33430] GAM2397 gene, herein designated GAM GENE, encodes a GAM2397 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2397 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2397 precursor RNA is designated SEQ ID:2374, and is provided hereinbelow with reference to the sequence listing part.

[33431] GAM2397 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33432] An enzyme complex designated DICER COMPLEX, dices the GAM2397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2397 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2397 RNA is designated SEQ ID:4988, and is provided hereinbelow with reference to the sequence listing part.

[33433] GAM2397 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2397 target RNA, herein designated GAM TARGET RNA. GAM2397 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33434] GAM2397 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2397 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2397 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2397 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2397 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33435] The complementary binding of GAM2397 RNA, herein designated GAM RNA, to target binding sites on GAM2397 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2397 target RNA, herein designated GAM TARGET RNA, into GAM2397 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33436] It is appreciated that GAM2397 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2397 target genes. The mRNA of each one of this plurality of GAM2397 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2397 RNA, herein designated GAM RNA, and which when bound by GAM2397 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2397 target proteins.

[33437] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2397 gene, herein designated GAM GENE, on one or more GAM2397 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33438] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2397 correlate with, and may be deduced from, the identity of the target

genes which GAM2397 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33439] Nucleotide sequences of the GAM2397 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2397 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2397 are further described hereinbelow with reference to Table 1.

[33440] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2397 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33441] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2398 (GAM2398) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33442] GAM2398 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2398 was detected is described hereinabove with reference to Figs. 2-8.

[33443] GAM2398 gene, herein designated GAM GENE, and GAM2398 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[33444] GAM2398 gene, herein designated GAM GENE, encodes a GAM2398 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2398 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2398 precursor RNA is designated SEQ ID:2375, and is provided hereinbelow with reference to the sequence listing part.

[33445] GAM2398 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33446] An enzyme complex designated DICER COMPLEX, dices the GAM2398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2398 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2398 RNA is designated SEQ ID:4989, and is provided

hereinbelow with reference to the sequence listing part.

[33447] GAM2398 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2398 target RNA, herein designated GAM TARGET RNA. GAM2398 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33448] GAM2398 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2398 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2398 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2398 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2398 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33449] The complementary binding of GAM2398 RNA, herein designated GAM RNA, to target binding sites on GAM2398 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2398 target RNA, herein designated GAM TARGET RNA, into GAM2398 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33450] It is appreciated that GAM2398 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2398 target genes. The mRNA of each one of this plurality of GAM2398 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2398 RNA, herein designated GAM RNA, and which when bound by GAM2398 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2398 target proteins.

[33451] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2398 gene, herein designated GAM GENE, on one or more GAM2398 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33452] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2398 correlate with, and may be deduced from, the identity of the target genes which GAM2398 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33453] Nucleotide sequences of the GAM2398 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2398 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2398 are further described hereinbelow with reference to Table 1.

[33454] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2398 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33455] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2399 (GAM2399) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33456] GAM2399 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2399 was detected is described hereinabove with reference to Figs. 2-8.

[33457] GAM2399 gene, herein designated GAM GENE, and GAM2399 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33458] GAM2399 gene, herein designated GAM GENE, encodes a GAM2399 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2399 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2399 precursor RNA is designated SEQ ID:2376, and is provided hereinbelow with reference to the sequence listing part.

[33459] GAM2399 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33460] An enzyme complex designated DICER COMPLEX, dices the GAM2399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2399 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2399 RNA is designated SEQ ID:4990, and is provided hereinbelow with reference to the sequence listing part.

[33461] GAM2399 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2399 target RNA, herein designated GAM TARGET RNA. GAM2399 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33462] GAM2399 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2399 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2399 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2399 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2399 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33463] The complementary binding of GAM2399 RNA, herein designated GAM RNA, to target binding sites on GAM2399 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2399 target RNA, herein designated GAM TARGET RNA, into GAM2399 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33464] It is appreciated that GAM2399 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2399 target genes. The mRNA of each one of this plurality of GAM2399 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2399 RNA, herein designated GAM RNA, and which when bound by GAM2399 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2399 target proteins.

[33465] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2399 gene, herein designated GAM GENE, on one or more GAM2399 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33466] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2399 correlate with, and may be deduced from, the identity of the target genes which GAM2399 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33467] Nucleotide sequences of the GAM2399 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2399 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2399 are further described hereinbelow with reference to Table 1.

[33468] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2399 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33469] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2400 (GAM2400) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33470] GAM2400 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2400 was detected is described hereinabove with reference to Figs. 2-8.

[33471] GAM2400 gene, herein designated GAM GENE, and GAM2400 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33472] GAM2400 gene, herein designated GAM GENE, encodes a GAM2400 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2400 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2400 precursor RNA is designated SEQ ID:2377, and is provided hereinbelow with reference to the sequence listing part.

[33473] GAM2400 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [33474] An enzyme complex designated DICER COMPLEX, dices the GAM2400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2400 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2400 RNA is designated SEQ ID:4991, and is provided hereinbelow with reference to the sequence listing part.
- [33475] GAM2400 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2400 target RNA, herein designated GAM TARGET RNA. GAM2400 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [33476] GAM2400 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2400 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2400 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2400 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2400 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33477] The complementary binding of GAM2400 RNA, herein designated GAM RNA, to target binding sites on GAM2400 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2400 target RNA, herein designated GAM TARGET RNA, into GAM2400 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33478] It is appreciated that GAM2400 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2400 target genes. The mRNA of each one of this plurality of GAM2400 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2400 RNA, herein designated GAM RNA, and which when bound by GAM2400 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2400 target proteins.

[33479] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2400 gene, herein designated GAM GENE, on one or more GAM2400 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33480] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2400 correlate with, and may be deduced from, the identity of the target genes which GAM2400 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33481] Nucleotide sequences of the GAM2400 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2400 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2400 are further described hereinbelow with reference to Table 1.

[33482] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2400 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[33483] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2401 (GAM2401) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33484] GAM2401 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2401 was detected is described hereinabove with reference to Figs. 2-8.

[33485] GAM2401 gene, herein designated GAM GENE, and GAM2401 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33486] GAM2401 gene, herein designated GAM GENE, encodes a GAM2401 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2401 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2401 precursor RNA is designated SEQ ID:2378, and is provided hereinbelow with reference to the sequence listing part.

[33487] GAM2401 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33488] An enzyme complex designated DICER COMPLEX, dices the GAM2401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2401 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM2401 RNA is designated SEQ ID:4992, and is provided hereinbelow with reference to the sequence listing part.

[33489] GAM2401 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2401 target RNA, herein designated GAM TARGET RNA. GAM2401 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33490] GAM2401 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2401 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2401 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2401 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2401 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33491] The complementary binding of GAM2401 RNA, herein designated GAM RNA, to target binding sites on GAM2401 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2401 target RNA, herein designated GAM TARGET RNA, into GAM2401 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33492] It is appreciated that GAM2401 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2401 target genes. The mRNA of each one of this plurality of GAM2401 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2401 RNA, herein designated GAM RNA, and which when bound by GAM2401 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2401 target proteins.

[33493] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2401 gene, herein designated GAM GENE, on one or more GAM2401 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33494] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2401 correlate with, and may be deduced from, the identity of the target genes which GAM2401 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33495] Nucleotide sequences of the GAM2401 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2401 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2401 are further described hereinbelow with reference to Table 1.

[33496] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2401 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33497] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2402 (GAM2402) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33498] GAM2402 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2402 was detected is described hereinabove with reference to Figs. 2-8.

[33499] GAM2402 gene, herein designated GAM GENE, and GAM2402 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33500] GAM2402 gene, herein designated GAM GENE, encodes a GAM2402 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2402 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2402 precursor RNA is designated SEQ ID:2379, and is provided hereinbelow with reference to the sequence listing part.

[33501] GAM2402 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33502] An enzyme complex designated DICER COMPLEX, dices the GAM2402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2402 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2402 RNA is designated SEQ ID:4993, and is provided hereinbelow with reference to the sequence listing part.

[33503] GAM2402 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2402 target RNA, herein designated GAM TARGET RNA. GAM2402 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33504] GAM2402 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2402 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2402 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2402 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2402 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33505] The complementary binding of GAM2402 RNA, herein designated GAM RNA, to target binding sites on GAM2402 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2402 target RNA, herein designated GAM TARGET RNA, into GAM2402 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33506] It is appreciated that GAM2402 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2402 target genes. The

mRNA of each one of this plurality of GAM2402 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2402 RNA, herein designated GAM RNA, and which when bound by GAM2402 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2402 target proteins.

[33507] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2402 gene, herein designated GAM GENE, on one or more GAM2402 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33508] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2402 correlate with, and may be deduced from, the identity of the target genes which GAM2402 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33509] Nucleotide sequences of the GAM2402 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2402 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2402 are further described hereinbelow with reference to Table 1.

[33510] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2402 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33511] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2403 (GAM2403) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33512] GAM2403 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2403 was detected is described hereinabove with reference to Figs. 2-8.

[33513] GAM2403 gene, herein designated GAM GENE, and GAM2403 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33514] GAM2403 gene, herein designated GAM GENE, encodes a GAM2403 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2403 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2403 precursor RNA is designated SEQ ID:2380, and is provided hereinbelow with reference to the sequence listing part.

[33515] GAM2403 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33516] An enzyme complex designated DICER COMPLEX, dices the GAM2403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2403 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2403 RNA is designated SEQ ID:4994, and is provided hereinbelow with reference to the sequence listing part.

[33517] GAM2403 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2403 target RNA, herein designated GAM TARGET RNA. GAM2403 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33518] GAM2403 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2403 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2403 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2403 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2403 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33519] The complementary binding of GAM2403 RNA, herein designated GAM RNA, to target binding sites on GAM2403 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2403 target RNA, herein designated GAM TARGET RNA, into GAM2403 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33520] It is appreciated that GAM2403 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2403 target genes. The mRNA of each one of this plurality of GAM2403 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2403 RNA, herein designated GAM RNA, and which when bound by GAM2403 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2403 target proteins.

[33521] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2403 gene, herein designated GAM GENE, on one or more GAM2403 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33522] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2403 correlate with, and may be deduced from, the identity of the target

genes which GAM2403 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33523] Nucleotide sequences of the GAM2403 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2403 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2403 are further described hereinbelow with reference to Table 1.

[33524] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2403 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33525] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2404 (GAM2404) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33526] GAM2404 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2404 was detected is described hereinabove with reference to Figs. 2-8.

[33527] GAM2404 gene, herein designated GAM GENE, and GAM2404 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[33528] GAM2404 gene, herein designated GAM GENE, encodes a GAM2404 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2404 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2404 precursor RNA is designated SEQ ID:2381, and is provided hereinbelow with reference to the sequence listing part.

[33529] GAM2404 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33530] An enzyme complex designated DICER COMPLEX, dices the GAM2404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2404 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2404 RNA is designated SEQ ID:4995, and is provided

hereinbelow with reference to the sequence listing part.

[33531] GAM2404 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2404 target RNA, herein designated GAM TARGET RNA. GAM2404 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33532] GAM2404 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2404 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2404 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2404 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2404 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33533] The complementary binding of GAM2404 RNA, herein designated GAM RNA, to target binding sites on GAM2404 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2404 target RNA, herein designated GAM TARGET RNA, into GAM2404 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33534] It is appreciated that GAM2404 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2404 target genes. The mRNA of each one of this plurality of GAM2404 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2404 RNA, herein designated GAM RNA, and which when bound by GAM2404 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2404 target proteins.

[33535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2404 gene, herein designated GAM GENE, on one or more GAM2404 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33536] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2404 correlate with, and may be deduced from, the identity of the target genes which GAM2404 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33537] Nucleotide sequences of the GAM2404 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2404 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2404 are further described hereinbelow with reference to Table 1.

[33538] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2404 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33539] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2405 (GAM2405) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33540] GAM2405 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2405 was detected is described hereinabove with reference to Figs. 2-8.

[33541] GAM2405 gene, herein designated GAM GENE, and GAM2405 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33542] GAM2405 gene, herein designated GAM GENE, encodes a GAM2405 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2405 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2405 precursor RNA is designated SEQ ID:2382, and is provided hereinbelow with reference to the sequence listing part.

[33543] GAM2405 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33544] An enzyme complex designated DICER COMPLEX, dices the GAM2405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2405 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2405 RNA is designated SEQ ID:4996, and is provided hereinbelow with reference to the sequence listing part.

[33545] GAM2405 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2405 target RNA, herein designated GAM TARGET RNA. GAM2405 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33546] GAM2405 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2405 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2405 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2405 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2405 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33547] The complementary binding of GAM2405 RNA, herein designated GAM RNA, to target binding sites on GAM2405 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2405 target RNA, herein designated GAM TARGET RNA, into GAM2405 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33548] It is appreciated that GAM2405 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2405 target genes. The mRNA of each one of this plurality of GAM2405 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2405 RNA, herein designated GAM RNA, and which when bound by GAM2405 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2405 target proteins.

[33549] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2405 gene, herein designated GAM GENE, on one or more GAM2405 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33550] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2405 correlate with, and may be deduced from, the identity of the target genes which GAM2405 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33551] Nucleotide sequences of the GAM2405 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2405 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2405 are further described hereinbelow with reference to Table 1.

[33552] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2405 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33553] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2406 (GAM2406) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33554] GAM2406 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2406 was detected is described hereinabove with reference to Figs. 2-8.

[33555] GAM2406 gene, herein designated GAM GENE, and GAM2406 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33556] GAM2406 gene, herein designated GAM GENE, encodes a GAM2406 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2406 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2406 precursor RNA is designated SEQ ID:2383, and is provided hereinbelow with reference to the sequence listing part.

[33557] GAM2406 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [33558] An enzyme complex designated DICER COMPLEX, dices the GAM2406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2406 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2406 RNA is designated SEQ ID:4997, and is provided hereinbelow with reference to the sequence listing part.
- [33559] GAM2406 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2406 target RNA, herein designated GAM TARGET RNA. GAM2406 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [33560] GAM2406 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2406 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2406 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2406 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2406 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33561] The complementary binding of GAM2406 RNA, herein designated GAM RNA, to target binding sites on GAM2406 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2406 target RNA, herein designated GAM TARGET RNA, into GAM2406 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33562] It is appreciated that GAM2406 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2406 target genes. The mRNA of each one of this plurality of GAM2406 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2406 RNA, herein designated GAM RNA, and which when bound by GAM2406 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2406 target proteins.

[33563] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2406 gene, herein designated GAM GENE, on one or more GAM2406 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33564] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2406 correlate with, and may be deduced from, the identity of the target genes which GAM2406 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33565] Nucleotide sequences of the GAM2406 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2406 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2406 are further described hereinbelow with reference to Table 1.

[33566] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2406 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [33567] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2407 (GAM2407) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [33568] GAM2407 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2407 was detected is described hereinabove with reference to Figs. 2-8.
- [33569] GAM2407 gene, herein designated GAM GENE, and GAM2407 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [33570] GAM2407 gene, herein designated GAM GENE, encodes a GAM2407 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2407 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2407 precursor RNA is designated SEQ ID:2384, and is provided hereinbelow with reference to the sequence listing part.
- [33571] GAM2407 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33572] An enzyme complex designated DICER COMPLEX, dices the GAM2407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2407 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2407 RNA is designated SEQ ID:4998, and is provided hereinbelow with reference to the sequence listing part.

[33573] GAM2407 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2407 target RNA, herein designated GAM TARGET RNA. GAM2407 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33574] GAM2407 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2407 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2407 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2407 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2407 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33575] The complementary binding of GAM2407 RNA, herein designated GAM RNA, to target binding sites on GAM2407 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2407 target RNA, herein designated GAM TARGET RNA, into GAM2407 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33576] It is appreciated that GAM2407 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2407 target genes. The mRNA of each one of this plurality of GAM2407 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2407 RNA, herein designated GAM RNA, and which when bound by GAM2407 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2407 target proteins.

[33577] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2407 gene, herein designated GAM GENE, on one or more GAM2407 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33578] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2407 correlate with, and may be deduced from, the identity of the target genes which GAM2407 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33579] Nucleotide sequences of the GAM2407 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2407 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2407 are further described hereinbelow with reference to Table 1.

[33580] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2407 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33581] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2408 (GAM2408) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33582] GAM2408 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2408 was detected is described hereinabove with reference to Figs. 2-8.

[33583] GAM2408 gene, herein designated GAM GENE, and GAM2408 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33584] GAM2408 gene, herein designated GAM GENE, encodes a GAM2408 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2408 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2408 precursor RNA is designated SEQ ID:2385, and is provided hereinbelow with reference to the sequence listing part.

[33585] GAM2408 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33586] An enzyme complex designated DICER COMPLEX, dices the GAM2408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2408 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2408 RNA is designated SEQ ID:4999, and is provided hereinbelow with reference to the sequence listing part.

[33587] GAM2408 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2408 target RNA, herein designated GAM TARGET RNA. GAM2408 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33588] GAM2408 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2408 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2408 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2408 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2408 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33589] The complementary binding of GAM2408 RNA, herein designated GAM RNA, to target binding sites on GAM2408 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2408 target RNA, herein designated GAM TARGET RNA, into GAM2408 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33590] It is appreciated that GAM2408 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2408 target genes. The

mRNA of each one of this plurality of GAM2408 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2408 RNA, herein designated GAM RNA, and which when bound by GAM2408 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2408 target proteins.

[33591] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2408 gene, herein designated GAM GENE, on one or more GAM2408 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33592] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2408 correlate with, and may be deduced from, the identity of the target genes which GAM2408 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33593] Nucleotide sequences of the GAM2408 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2408 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2408 are further described hereinbelow with reference to Table 1.

[33594] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2408 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33595] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2409 (GAM2409) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33596] GAM2409 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2409 was detected is described hereinabove with reference to Figs. 2-8.

[33597] GAM2409 gene, herein designated GAM GENE, and GAM2409 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33598] GAM2409 gene, herein designated GAM GENE, encodes a GAM2409 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2409 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2409 precursor RNA is designated SEQ ID:2386, and is provided hereinbelow with reference to the sequence listing part.

[33599] GAM2409 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2409 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33600] An enzyme complex designated DICER COMPLEX, dices the GAM2409 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2409 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2409 RNA is designated SEQ ID:5000, and is provided hereinbelow with reference to the sequence listing part.

[33601] GAM2409 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2409 target RNA, herein designated GAM TARGET RNA. GAM2409 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33602] GAM2409 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2409 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2409 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2409 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2409 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33603] The complementary binding of GAM2409 RNA, herein designated GAM RNA, to target binding sites on GAM2409 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2409 target RNA, herein designated GAM TARGET RNA, into GAM2409 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33604] It is appreciated that GAM2409 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2409 target genes. The mRNA of each one of this plurality of GAM2409 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2409 RNA, herein designated GAM RNA, and which when bound by GAM2409 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2409 target proteins.

[33605] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2409 gene, herein designated GAM GENE, on one or more GAM2409 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33606] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2409 correlate with, and may be deduced from, the identity of the target

genes which GAM2409 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33607] Nucleotide sequences of the GAM2409 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2409 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2409 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2409 are further described hereinbelow with reference to Table 1.

[33608] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2409 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33609] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2410 (GAM2410) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33610] GAM2410 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2410 was detected is described hereinabove with reference to Figs. 2-8.

[33611] GAM2410 gene, herein designated GAM GENE, and GAM2410 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

- [33612] GAM2410 gene, herein designated GAM GENE, encodes a GAM2410 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2410 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2410 precursor RNA is designated SEQ ID:2387, and is provided hereinbelow with reference to the sequence listing part.
- [33613] GAM2410 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [33614] An enzyme complex designated DICER COMPLEX, dices the GAM2410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2410 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2410 RNA is designated SEQ ID:5001, and is provided

hereinbelow with reference to the sequence listing part.

[33615] GAM2410 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2410 target RNA, herein designated GAM TARGET RNA. GAM2410 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33616] GAM2410 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2410 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2410 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2410 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2410 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33617] The complementary binding of GAM2410 RNA, herein designated GAM RNA, to target binding sites on GAM2410 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2410 target RNA, herein designated GAM TARGET RNA, into GAM2410 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33618] It is appreciated that GAM2410 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2410 target genes. The mRNA of each one of this plurality of GAM2410 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2410 RNA, herein designated GAM RNA, and which when bound by GAM2410 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2410 target proteins.

[33619] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2410 gene, herein designated GAM GENE, on one or more GAM2410 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33620] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2410 correlate with, and may be deduced from, the identity of the target genes which GAM2410 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33621] Nucleotide sequences of the GAM2410 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2410 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2410 are further described hereinbelow with reference to Table 1.

[33622] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2410 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33623] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2411 (GAM2411) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33624] GAM2411 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2411 was detected is described hereinabove with reference to Figs. 2-8.

[33625] GAM2411 gene, herein designated GAM GENE, and GAM2411 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33626] GAM2411 gene, herein designated GAM GENE, encodes a GAM2411 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2411 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2411 precursor RNA is designated SEQ ID:2388, and is provided hereinbelow with reference to the sequence listing part.

[33627] GAM2411 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33628] An enzyme complex designated DICER COMPLEX, dices the GAM2411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2411 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2411 RNA is designated SEQ ID:5002, and is provided hereinbelow with reference to the sequence listing part.

[33629] GAM2411 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2411 target RNA, herein designated GAM TARGET RNA. GAM2411 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33630] GAM2411 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2411 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2411 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2411 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2411 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33631] The complementary binding of GAM2411 RNA, herein designated GAM RNA, to target binding sites on GAM2411 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2411 target RNA, herein designated GAM TARGET RNA, into GAM2411 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33632] It is appreciated that GAM2411 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2411 target genes. The mRNA of each one of this plurality of GAM2411 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2411 RNA, herein designated GAM RNA, and which when bound by GAM2411 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2411 target proteins.

[33633] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2411 gene, herein designated GAM GENE, on one or more GAM2411 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33634] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2411 correlate with, and may be deduced from, the identity of the target genes which GAM2411 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33635] Nucleotide sequences of the GAM2411 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2411 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2411 are further described hereinbelow with reference to Table 1.

[33636] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2411 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33637] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2412 (GAM2412) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33638] GAM2412 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2412 was detected is described hereinabove with reference to Figs. 2-8.

[33639] GAM2412 gene, herein designated GAM GENE, and GAM2412 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33640] GAM2412 gene, herein designated GAM GENE, encodes a GAM2412 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2412 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2412 precursor RNA is designated SEQ ID:2389, and is provided hereinbelow with reference to the sequence listing part.

[33641] GAM2412 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2412 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [33642] An enzyme complex designated DICER COMPLEX, dices the GAM2412 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2412 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2412 RNA is designated SEQ ID:5003, and is provided hereinbelow with reference to the sequence listing part.
- [33643] GAM2412 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2412 target RNA, herein designated GAM TARGET RNA. GAM2412 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [33644] GAM2412 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2412 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2412 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2412 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2412 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33645] The complementary binding of GAM2412 RNA, herein designated GAM RNA, to target binding sites on GAM2412 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2412 target RNA, herein designated GAM TARGET RNA, into GAM2412 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33646] It is appreciated that GAM2412 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2412 target genes. The mRNA of each one of this plurality of GAM2412 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2412 RNA, herein designated GAM RNA, and which when bound by GAM2412 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2412 target proteins.

[33647] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2412 gene, herein designated GAM GENE, on one or more GAM2412 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33648] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2412 correlate with, and may be deduced from, the identity of the target genes which GAM2412 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33649] Nucleotide sequences of the GAM2412 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2412 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2412 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2412 are further described hereinbelow with reference to Table 1.

[33650] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2412 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[33651] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2413 (GAM2413) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33652] GAM2413 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2413 was detected is described hereinabove with reference to Figs. 2-8.

[33653] GAM2413 gene, herein designated GAM GENE, and GAM2413 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33654] GAM2413 gene, herein designated GAM GENE, encodes a GAM2413 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2413 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2413 precursor RNA is designated SEQ ID:2390, and is provided hereinbelow with reference to the sequence listing part.

[33655] GAM2413 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33656] An enzyme complex designated DICER COMPLEX, dices the GAM2413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2413 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2413 RNA is designated SEQ ID:5005, and is provided hereinbelow with reference to the sequence listing part.

[33657] GAM2413 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2413 target RNA, herein designated GAM TARGET RNA. GAM2413 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33658] GAM2413 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2413 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2413 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2413 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2413 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[33659] The complementary binding of GAM2413 RNA, herein designated GAM RNA, to target binding sites on GAM2413 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2413 target RNA, herein designated GAM TARGET RNA, into GAM2413 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33660] It is appreciated that GAM2413 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2413 target genes. The mRNA of each one of this plurality of GAM2413 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2413 RNA, herein designated GAM RNA, and which when bound by GAM2413 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2413 target proteins.

[33661] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2413 gene, herein designated GAM GENE, on one or more GAM2413 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33662] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2413 correlate with, and may be deduced from, the identity of the target genes which GAM2413 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33663] Nucleotide sequences of the GAM2413 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2413 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2413 are further described hereinbelow with reference to Table 1.

[33664] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2413 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33665] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2414 (GAM2414) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [33666] GAM2414 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2414 was detected is described hereinabove with reference to Figs. 2-8.
- [33667] GAM2414 gene, herein designated GAM GENE, and GAM2414 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [33668] GAM2414 gene, herein designated GAM GENE, encodes a GAM2414 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2414 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2414 precursor RNA is designated SEQ ID:2391, and is provided hereinbelow with reference to the sequence listing part.
- [33669] GAM2414 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [33670] An enzyme complex designated DICER COMPLEX, dices the GAM2414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2414 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2414 RNA is designated SEQ ID:5004, and is provided hereinbelow with reference to the sequence listing part.

[33671] GAM2414 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2414 target RNA, herein designated GAM TARGET RNA. GAM2414 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33672] GAM2414 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2414 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2414 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2414 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2414 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33673] The complementary binding of GAM2414 RNA, herein designated GAM RNA, to target binding sites on GAM2414 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2414 target RNA, herein designated GAM TARGET RNA, into GAM2414 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33674] It is appreciated that GAM2414 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2414 target genes. The mRNA of each one of this plurality of GAM2414 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2414 RNA, herein designated GAM RNA, and which when bound by GAM2414 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2414 target proteins.

[33675] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2414 gene, herein designated GAM GENE, on one or more GAM2414 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33676] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2414 correlate with, and may be deduced from, the identity of the target genes which GAM2414 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33677] Nucleotide sequences of the GAM2414 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2414 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2414 are further described hereinbelow with reference to Table 1.

[33678] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2414 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33679] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 2415 (GAM2415) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [33680] GAM2415 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2415 was detected is described hereinabove with reference to Figs. 2-8.
- [33681] GAM2415 gene, herein designated GAM GENE, and GAM2415 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [33682] GAM2415 gene, herein designated GAM GENE, encodes a GAM2415 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2415 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2415 precursor RNA is designated SEQ ID:2392, and is provided hereinbelow with reference to the sequence listing part.
- [33683] GAM2415 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [33684] An enzyme complex designated DICER COMPLEX, dices the GAM2415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2415 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2415 RNA is designated SEQ ID:5006, and is provided hereinbelow with reference to the sequence listing part.
- [33685] GAM2415 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2415 target RNA, herein designated GAM TARGET RNA. GAM2415 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [33686] GAM2415 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2415 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2415 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2415 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2415 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33687] The complementary binding of GAM2415 RNA, herein designated GAM RNA, to target binding sites on GAM2415 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2415 target RNA, herein designated GAM TARGET RNA, into GAM2415 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33688] It is appreciated that GAM2415 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2415 target genes. The mRNA of each one of this plurality of GAM2415 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2415 RNA, herein designated GAM RNA, and which when bound by GAM2415 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2415 target proteins.

[33689] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2415 gene, herein designated GAM GENE, on one or more GAM2415 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33690] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2415 correlate with, and may be deduced from, the identity of the target genes which GAM2415 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33691] Nucleotide sequences of the GAM2415 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2415 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2415 are further described hereinbelow with reference to Table 1.

[33692] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2415 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[33693] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2416 (GAM2416) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33694] GAM2416 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2416 was detected is described hereinabove with reference to Figs. 2-8.

[33695] GAM2416 gene, herein designated GAM GENE, and GAM2416 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33696] GAM2416 gene, herein designated GAM GENE, encodes a GAM2416 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2416 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2416 precursor RNA is designated SEQ ID:2393, and is provided hereinbelow with reference to the sequence listing part.

[33697] GAM2416 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33698] An enzyme complex designated DICER COMPLEX, dices the GAM2416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2416 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2416 RNA is designated SEQ ID:5007, and is provided hereinbelow with reference to the sequence listing part.

[33699] GAM2416 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2416 target RNA, herein designated GAM TARGET RNA. GAM2416 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33700] GAM2416 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2416 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2416 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2416 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2416 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33701] The complementary binding of GAM2416 RNA, herein designated GAM RNA, to target binding sites on GAM2416 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2416 target RNA, herein designated GAM TARGET RNA, into GAM2416 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33702] It is appreciated that GAM2416 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2416 target genes. The mRNA of each one of this plurality of GAM2416 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2416 RNA, herein designated GAM RNA, and which when bound by GAM2416 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2416 target proteins.

[33703] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2416 gene, herein designated GAM GENE, on one or more GAM2416 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33704] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2416 correlate with, and may be deduced from, the identity of the target genes which GAM2416 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33705] Nucleotide sequences of the GAM2416 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2416 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2416 are further described hereinbelow with reference to Table 1.

[33706] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2416 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33707] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2417 (GAM2417) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33708] GAM2417 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2417 was detected is described hereinabove with reference to Figs. 2-8.

[33709] GAM2417 gene, herein designated GAM GENE, and GAM2417 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33710] GAM2417 gene, herein designated GAM GENE, encodes a GAM2417 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2417 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2417 precursor RNA is designated SEQ ID:2394, and is provided hereinbelow with reference to the sequence listing part.

[33711] GAM2417 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33712] An enzyme complex designated DICER COMPLEX, dices the GAM2417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2417 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2417 RNA is designated SEQ ID:5008, and is provided hereinbelow with reference to the sequence listing part.

[33713] GAM2417 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2417 target RNA, herein designated GAM TARGET RNA. GAM2417 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33714] GAM2417 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2417 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2417 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2417 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2417 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33715] The complementary binding of GAM2417 RNA, herein designated GAM RNA, to target binding sites on GAM2417 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2417 target RNA, herein designated GAM TARGET RNA, into GAM2417 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33716] It is appreciated that GAM2417 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2417 target genes. The

mRNA of each one of this plurality of GAM2417 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2417 RNA, herein designated GAM RNA, and which when bound by GAM2417 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2417 target proteins.

[33717] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2417 gene, herein designated GAM GENE, on one or more GAM2417 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33718] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2417 correlate with, and may be deduced from, the identity of the target genes which GAM2417 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33719] Nucleotide sequences of the GAM2417 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2417 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2417 are further described hereinbelow with reference to Table 1.

[33720] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2417 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33721] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2418 (GAM2418) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33722] GAM2418 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2418 was detected is described hereinabove with reference to Figs. 2-8.

[33723] GAM2418 gene, herein designated GAM GENE, and GAM2418 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33724] GAM2418 gene, herein designated GAM GENE, encodes a GAM2418 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2418 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2418 precursor RNA is designated SEQ ID:2395, and is provided hereinbelow with reference to the sequence listing part.

[33725] GAM2418 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33726] An enzyme complex designated DICER COMPLEX, dices the GAM2418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2418 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2418 RNA is designated SEQ ID:5009, and is provided hereinbelow with reference to the sequence listing part.

[33727] GAM2418 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2418 target RNA, herein designated GAM TARGET RNA. GAM2418 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33728] GAM2418 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2418 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2418 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2418 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2418 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33729] The complementary binding of GAM2418 RNA, herein designated GAM RNA, to target binding sites on GAM2418 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2418 target RNA, herein designated GAM TARGET RNA, into GAM2418 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33730] It is appreciated that GAM2418 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2418 target genes. The mRNA of each one of this plurality of GAM2418 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2418 RNA, herein designated GAM RNA, and which when bound by GAM2418 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2418 target proteins.

[33731] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2418 gene, herein designated GAM GENE, on one or more GAM2418 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33732] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2418 correlate with, and may be deduced from, the identity of the target

genes which GAM2418 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33733] Nucleotide sequences of the GAM2418 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2418 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2418 are further described hereinbelow with reference to Table 1.

[33734] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2418 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33735] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2419 (GAM2419) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33736] GAM2419 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2419 was detected is described hereinabove with reference to Figs. 2-8.

[33737] GAM2419 gene, herein designated GAM GENE, and GAM2419 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[33738] GAM2419 gene, herein designated GAM GENE, encodes a GAM2419 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2419 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2419 precursor RNA is designated SEQ ID:2396, and is provided hereinbelow with reference to the sequence listing part.

[33739] GAM2419 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33740] An enzyme complex designated DICER COMPLEX, dices the GAM2419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2419 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2419 RNA is designated SEQ ID:5010, and is provided

hereinbelow with reference to the sequence listing part.

[33741] GAM2419 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2419 target RNA, herein designated GAM TARGET RNA. GAM2419 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33742] GAM2419 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2419 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2419 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2419 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2419 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33743] The complementary binding of GAM2419 RNA, herein designated GAM RNA, to target binding sites on GAM2419 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2419 target RNA, herein designated GAM TARGET RNA, into GAM2419 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33744] It is appreciated that GAM2419 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2419 target genes. The mRNA of each one of this plurality of GAM2419 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2419 RNA, herein designated GAM RNA, and which when bound by GAM2419 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2419 target proteins.

[33745] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2419 gene, herein designated GAM GENE, on one or more GAM2419 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33746] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2419 correlate with, and may be deduced from, the identity of the target genes which GAM2419 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33747] Nucleotide sequences of the GAM2419 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2419 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2419 are further described hereinbelow with reference to Table 1.

[33748] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2419 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33749] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2420 (GAM2420) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33750] GAM2420 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2420 was detected is described hereinabove with reference to Figs. 2-8.

[33751] GAM2420 gene, herein designated GAM GENE, and GAM2420 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33752] GAM2420 gene, herein designated GAM GENE, encodes a GAM2420 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2420 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2420 precursor RNA is designated SEQ ID:2397, and is provided hereinbelow with reference to the sequence listing part.

[33753] GAM2420 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33754] An enzyme complex designated DICER COMPLEX, dices the GAM2420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2420 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM2420 RNA is designated SEQ ID:5011, and is provided hereinbelow with reference to the sequence listing part.

[33755] GAM2420 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2420 target RNA, herein designated GAM TARGET RNA. GAM2420 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33756] GAM2420 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2420 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2420 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2420 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2420 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33757] The complementary binding of GAM2420 RNA, herein designated GAM RNA, to target binding sites on GAM2420 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2420 target RNA, herein designated GAM TARGET RNA, into GAM2420 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33758] It is appreciated that GAM2420 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2420 target genes. The mRNA of each one of this plurality of GAM2420 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2420 RNA, herein designated GAM RNA, and which when bound by GAM2420 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2420 target proteins.

[33759] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2420 gene, herein designated GAM GENE, on one or more GAM2420 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33760] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2420 correlate with, and may be deduced from, the identity of the target genes which GAM2420 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33761] Nucleotide sequences of the GAM2420 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2420 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2420 are further described hereinbelow with reference to Table 1.

[33762] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2420 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33763] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2421 (GAM2421) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33764] GAM2421 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2421 was detected is described hereinabove with reference to Figs. 2-8.

[33765] GAM2421 gene, herein designated GAM GENE, and GAM2421 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33766] GAM2421 gene, herein designated GAM GENE, encodes a GAM2421 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2421 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2421 precursor RNA is designated SEQ ID:2398, and is provided hereinbelow with reference to the sequence listing part.

[33767] GAM2421 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [33768] An enzyme complex designated DICER COMPLEX, dices the GAM2421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2421 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM2421 RNA is designated SEQ ID:5012, and is provided hereinbelow with reference to the sequence listing part.
- [33769] GAM2421 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2421 target RNA, herein designated GAM TARGET RNA. GAM2421 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [33770] GAM2421 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2421 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2421 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2421 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2421 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33771] The complementary binding of GAM2421 RNA, herein designated GAM RNA, to target binding sites on GAM2421 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2421 target RNA, herein designated GAM TARGET RNA, into GAM2421 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33772] It is appreciated that GAM2421 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2421 target genes. The mRNA of each one of this plurality of GAM2421 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2421 RNA, herein designated GAM RNA, and which when bound by GAM2421 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2421 target proteins.

[33773] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2421 gene, herein designated GAM GENE, on one or more GAM2421 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33774] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2421 correlate with, and may be deduced from, the identity of the target genes which GAM2421 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33775] Nucleotide sequences of the GAM2421 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2421 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2421 are further described hereinbelow with reference to Table 1.

[33776] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2421 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[33777] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2422 (GAM2422) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33778] GAM2422 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2422 was detected is described hereinabove with reference to Figs. 2-8.

[33779] GAM2422 gene, herein designated GAM GENE, and GAM2422 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33780] GAM2422 gene, herein designated GAM GENE, encodes a GAM2422 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2422 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2422 precursor RNA is designated SEQ ID:2399, and is provided hereinbelow with reference to the sequence listing part.

[33781] GAM2422 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33782] An enzyme complex designated DICER COMPLEX, dices the GAM2422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2422 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2422 RNA is designated SEQ ID:5014, and is provided hereinbelow with reference to the sequence listing part.

[33783] GAM2422 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2422 target RNA, herein designated GAM TARGET RNA. GAM2422 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33784] GAM2422 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2422 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2422 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2422 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2422 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33785] The complementary binding of GAM2422 RNA, herein designated GAM RNA, to target binding sites on GAM2422 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2422 target RNA, herein designated GAM TARGET RNA, into GAM2422 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33786] It is appreciated that GAM2422 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2422 target genes. The mRNA of each one of this plurality of GAM2422 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2422 RNA, herein designated GAM RNA, and which when bound by GAM2422 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2422 target proteins.

[33787] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2422 gene, herein designated GAM GENE, on one or more GAM2422 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33788] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2422 correlate with, and may be deduced from, the identity of the target genes which GAM2422 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33789] Nucleotide sequences of the GAM2422 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2422 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2422 are further described hereinbelow with reference to Table 1.

[33790] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2422 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33791] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2423 (GAM2423) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33792] GAM2423 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2423 was detected is described hereinabove with reference to Figs. 2-8.

[33793] GAM2423 gene, herein designated GAM GENE, and GAM2423 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33794] GAM2423 gene, herein designated GAM GENE, encodes a GAM2423 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2423 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2423 precursor RNA is designated SEQ ID:2400, and is provided hereinbelow with reference to the sequence listing part.

[33795] GAM2423 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33796] An enzyme complex designated DICER COMPLEX, dices the GAM2423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2423 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2423 RNA is designated SEQ ID:5013, and is provided hereinbelow with reference to the sequence listing part.

[33797] GAM2423 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2423 target RNA, herein designated GAM TARGET RNA. GAM2423 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33798] GAM2423 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2423 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2423 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2423 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2423 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33799] The complementary binding of GAM2423 RNA, herein designated GAM RNA, to target binding sites on GAM2423 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2423 target RNA, herein designated GAM TARGET RNA, into GAM2423 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33800] It is appreciated that GAM2423 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2423 target genes. The

mRNA of each one of this plurality of GAM2423 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2423 RNA, herein designated GAM RNA, and which when bound by GAM2423 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2423 target proteins.

[33801] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2423 gene, herein designated GAM GENE, on one or more GAM2423 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33802] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2423 correlate with, and may be deduced from, the identity of the target genes which GAM2423 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33803] Nucleotide sequences of the GAM2423 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2423 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2423 are further described hereinbelow with reference to Table 1.

[33804] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2423 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33805]

[33806] Fig. 8 further provides a conceptual description of a novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2424 (GAM2424) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33807] GAM2424 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2424 was detected is described hereinabove with reference to Figs. 2-8.

[33808] GAM2424 gene, herein designated GAM GENE, and GAM2424 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33809] GAM2424 gene, herein designated GAM GENE, encodes a GAM2424 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM2424 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2424 precursor RNA is designated SEQ ID:2401, and is provided hereinbelow with reference to the sequence listing part.

[33810] GAM2424 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33811] An enzyme complex designated DICER COMPLEX, dices the GAM2424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2424 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM2424 RNA is designated SEQ ID:5015, and is provided hereinbelow with reference to the sequence listing part.

[33812] GAM2424 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2424 target RNA, herein designated

GAM TARGET RNA. GAM2424 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33813] GAM2424 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2424 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2424 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2424 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2424 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33814] The complementary binding of GAM2424 RNA, herein designated GAM RNA, to target binding sites on GAM2424 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2424 target RNA, herein

designated GAM TARGET RNA, into GAM2424 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33815] It is appreciated that GAM2424 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2424 target genes. The mRNA of each one of this plurality of GAM2424 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2424 RNA, herein designated GAM RNA, and which when bound by GAM2424 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2424 target proteins.

[33816] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2424 gene, herein designated GAM GENE, on one or more GAM2424 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33817] It is yet further appreciated that specific functions, and accordingly utilities, of

GAM2424 correlate with, and may be deduced from, the identity of the target genes which GAM2424 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33818] Nucleotide sequences of the GAM2424 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2424 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2424 are further described hereinbelow with reference to Table 1.

[33819] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2424 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33820] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2425 (GAM2425) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33821] GAM2425 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2425 was detected is described hereinabove with reference to Figs. 2-8.

[33822] GAM2425 gene, herein designated GAM GENE, and GAM2425 target gene,

herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33823] GAM2425 gene, herein designated GAM GENE, encodes a GAM2425 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2425 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2425 precursor RNA is designated SEQ ID:2402, and is provided hereinbelow with reference to the sequence listing part.

[33824] GAM2425 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2425 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33825] An enzyme complex designated DICER COMPLEX, dices the GAM2425 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2425 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide

sequence of GAM2425 RNA is designated SEQ ID:5016, and is provided hereinbelow with reference to the sequence listing part.

[33826] GAM2425 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2425 target RNA, herein designated GAM TARGET RNA. GAM2425 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33827] GAM2425 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2425 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2425 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2425 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2425 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33828] The complementary binding of GAM2425 RNA, herein designated GAM RNA, to target binding sites on GAM2425 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2425 target RNA, herein designated GAM TARGET RNA, into GAM2425 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33829] It is appreciated that GAM2425 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2425 target genes. The mRNA of each one of this plurality of GAM2425 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2425 RNA, herein designated GAM RNA, and which when bound by GAM2425 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2425 target proteins.

[33830] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2425 gene, herein designated GAM GENE, on one or more GAM2425 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33831] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2425 correlate with, and may be deduced from, the identity of the target genes which GAM2425 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33832] Nucleotide sequences of the GAM2425 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2425 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2425 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2425 are further described hereinbelow with reference to Table 1.

[33833] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2425 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33834] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2426 (GAM2426) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33835] GAM2426 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2426 was detected is described hereinabove with reference to Figs. 2-8.

[33836] GAM2426 gene, herein designated GAM GENE, and GAM2426 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33837] GAM2426 gene, herein designated GAM GENE, encodes a GAM2426 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2426 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2426 precursor RNA is designated SEQ ID:2403, and is provided hereinbelow with reference to the sequence listing part.

[33838] GAM2426 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33839] An enzyme complex designated DICER COMPLEX, dices the GAM2426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2426 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of GAM2426 RNA is designated SEQ ID:5017, and is provided hereinbelow with reference to the sequence listing part.

[33840] GAM2426 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2426 target RNA, herein designated GAM TARGET RNA. GAM2426 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33841] GAM2426 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2426 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2426 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2426 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2426 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33842] The complementary binding of GAM2426 RNA, herein designated GAM RNA, to target binding sites on GAM2426 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2426 target RNA, herein designated GAM TARGET RNA, into GAM2426 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33843] It is appreciated that GAM2426 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2426 target genes. The mRNA of each one of this plurality of GAM2426 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2426 RNA, herein designated GAM RNA, and which when bound by GAM2426 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2426 target proteins.

[33844] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2426 gene, herein designated GAM GENE, on one or more GAM2426 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33845] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2426 correlate with, and may be deduced from, the identity of the target genes which GAM2426 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33846] Nucleotide sequences of the GAM2426 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2426 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2426 are further described hereinbelow with reference to Table 1.

[33847] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2426 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33848] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2427 (GAM2427) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33849] GAM2427 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2427 was detected is described hereinabove with reference to Figs. 2-8.

[33850] GAM2427 gene, herein designated GAM GENE, and GAM2427 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33851] GAM2427 gene, herein designated GAM GENE, encodes a GAM2427 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2427 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2427 precursor RNA is designated SEQ ID:2404, and is provided hereinbelow with reference to the sequence listing part.

[33852] GAM2427 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2427 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [33853] An enzyme complex designated DICER COMPLEX, dices the GAM2427 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2427 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2427 RNA is designated SEQ ID:5018, and is provided hereinbelow with reference to the sequence listing part.
- [33854] GAM2427 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2427 target RNA, herein designated GAM TARGET RNA. GAM2427 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [33855] GAM2427 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2427 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2427 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2427 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2427 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33856] The complementary binding of GAM2427 RNA, herein designated GAM RNA, to target binding sites on GAM2427 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2427 target RNA, herein designated GAM TARGET RNA, into GAM2427 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33857] It is appreciated that GAM2427 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2427 target genes. The mRNA of each one of this plurality of GAM2427 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2427 RNA, herein designated GAM RNA, and which when bound by GAM2427 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2427 target proteins.

[33858] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2427 gene, herein designated GAM GENE, on one or more GAM2427 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33859] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2427 correlate with, and may be deduced from, the identity of the target genes which GAM2427 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33860] Nucleotide sequences of the GAM2427 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2427 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2427 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2427 are further described hereinbelow with reference to Table 1.

[33861] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2427 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[33862] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2428 (GAM2428) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33863] GAM2428 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2428 was detected is described hereinabove with reference to Figs. 2-8.

[33864] GAM2428 gene, herein designated GAM GENE, and GAM2428 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33865] GAM2428 gene, herein designated GAM GENE, encodes a GAM2428 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2428 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2428 precursor RNA is designated SEQ ID:2405, and is provided hereinbelow with reference to the sequence listing part.

[33866] GAM2428 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33867] An enzyme complex designated DICER COMPLEX, dices the GAM2428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2428 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2428 RNA is designated SEQ ID:5019, and is provided hereinbelow with reference to the sequence listing part.

[33868] GAM2428 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2428 target RNA, herein designated GAM TARGET RNA. GAM2428 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33869] GAM2428 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2428 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2428 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2428 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2428 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33870] The complementary binding of GAM2428 RNA, herein designated GAM RNA, to target binding sites on GAM2428 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2428 target RNA, herein designated GAM TARGET RNA, into GAM2428 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33871] It is appreciated that GAM2428 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2428 target genes. The mRNA of each one of this plurality of GAM2428 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2428 RNA, herein designated GAM RNA, and which when bound by GAM2428 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2428 target proteins.

[33872] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2428 gene, herein designated GAM GENE, on one or more GAM2428 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33873] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2428 correlate with, and may be deduced from, the identity of the target genes which GAM2428 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33874] Nucleotide sequences of the GAM2428 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2428 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2428 are further described hereinbelow with reference to Table 1.

[33875] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2428 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33876] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2429 (GAM2429) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33877] GAM2429 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2429 was detected is described hereinabove with reference to Figs. 2-8.

[33878] GAM2429 gene, herein designated GAM GENE, and GAM2429 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33879] GAM2429 gene, herein designated GAM GENE, encodes a GAM2429 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2429 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2429 precursor RNA is designated SEQ ID:2406, and is provided hereinbelow with reference to the sequence listing part.

[33880] GAM2429 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33881] An enzyme complex designated DICER COMPLEX, dices the GAM2429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2429 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2429 RNA is designated SEQ ID:5020, and is provided hereinbelow with reference to the sequence listing part.

[33882] GAM2429 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2429 target RNA, herein designated GAM TARGET RNA. GAM2429 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33883] GAM2429 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2429 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2429 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2429 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2429 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33884] The complementary binding of GAM2429 RNA, herein designated GAM RNA, to target binding sites on GAM2429 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2429 target RNA, herein designated GAM TARGET RNA, into GAM2429 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33885] It is appreciated that GAM2429 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2429 target genes. The

mRNA of each one of this plurality of GAM2429 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2429 RNA, herein designated GAM RNA, and which when bound by GAM2429 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2429 target proteins.

[33886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2429 gene, herein designated GAM GENE, on one or more GAM2429 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33887] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2429 correlate with, and may be deduced from, the identity of the target genes which GAM2429 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33888] Nucleotide sequences of the GAM2429 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2429 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2429 are further described hereinbelow with reference to Table 1.

[33889] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2429 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33890] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2430 (GAM2430) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33891] GAM2430 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2430 was detected is described hereinabove with reference to Figs. 2-8.

[33892] GAM2430 gene, herein designated GAM GENE, and GAM2430 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33893] GAM2430 gene, herein designated GAM GENE, encodes a GAM2430 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2430 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2430 precursor RNA is designated SEQ ID:2407, and is provided hereinbelow with reference to the sequence listing part.

[33894] GAM2430 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33895] An enzyme complex designated DICER COMPLEX, dices the GAM2430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2430 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2430 RNA is designated SEQ ID:5021, and is provided hereinbelow with reference to the sequence listing part.

[33896] GAM2430 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2430 target RNA, herein designated GAM TARGET RNA. GAM2430 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33897] GAM2430 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2430 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2430 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2430 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2430 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33898] The complementary binding of GAM2430 RNA, herein designated GAM RNA, to target binding sites on GAM2430 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2430 target RNA, herein designated GAM TARGET RNA, into GAM2430 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33899] It is appreciated that GAM2430 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2430 target genes. The mRNA of each one of this plurality of GAM2430 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2430 RNA, herein designated GAM RNA, and which when bound by GAM2430 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2430 target proteins.

[33900] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2430 gene, herein designated GAM GENE, on one or more GAM2430 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33901] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2430 correlate with, and may be deduced from, the identity of the target

genes which GAM2430 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33902] Nucleotide sequences of the GAM2430 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2430 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2430 are further described hereinbelow with reference to Table 1.

[33903] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2430 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33904] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2431 (GAM2431) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33905] GAM2431 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2431 was detected is described hereinabove with reference to Figs. 2-8.

[33906] GAM2431 gene, herein designated GAM GENE, and GAM2431 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[33907] GAM2431 gene, herein designated GAM GENE, encodes a GAM2431 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2431 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2431 precursor RNA is designated SEQ ID:2408, and is provided hereinbelow with reference to the sequence listing part.

[33908] GAM2431 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33909] An enzyme complex designated DICER COMPLEX, dices the GAM2431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2431 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2431 RNA is designated SEQ ID:5022, and is provided

hereinbelow with reference to the sequence listing part.

[33910] GAM2431 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2431 target RNA, herein designated GAM TARGET RNA. GAM2431 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33911] GAM2431 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2431 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2431 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2431 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2431 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33912] The complementary binding of GAM2431 RNA, herein designated GAM RNA, to target binding sites on GAM2431 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2431 target RNA, herein designated GAM TARGET RNA, into GAM2431 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33913] It is appreciated that GAM2431 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2431 target genes. The mRNA of each one of this plurality of GAM2431 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2431 RNA, herein designated GAM RNA, and which when bound by GAM2431 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2431 target proteins.

[33914] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2431 gene, herein designated GAM GENE, on one or more GAM2431 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33915] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2431 correlate with, and may be deduced from, the identity of the target genes which GAM2431 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33916] Nucleotide sequences of the GAM2431 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2431 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2431 are further described hereinbelow with reference to Table 1.

[33917] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2431 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33918] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2432 (GAM2432) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33919] GAM2432 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2432 was detected is described hereinabove with reference to Figs. 2-8.

[33920] GAM2432 gene, herein designated GAM GENE, and GAM2432 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33921] GAM2432 gene, herein designated GAM GENE, encodes a GAM2432 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2432 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2432 precursor RNA is designated SEQ ID:2409, and is provided hereinbelow with reference to the sequence listing part.

[33922] GAM2432 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33923] An enzyme complex designated DICER COMPLEX, dices the GAM2432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2432 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2432 RNA is designated SEQ ID:5023, and is provided hereinbelow with reference to the sequence listing part.

[33924] GAM2432 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2432 target RNA, herein designated GAM TARGET RNA. GAM2432 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33925] GAM2432 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2432 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2432 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2432 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2432 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33926] The complementary binding of GAM2432 RNA, herein designated GAM RNA, to target binding sites on GAM2432 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2432 target RNA, herein designated GAM TARGET RNA, into GAM2432 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33927] It is appreciated that GAM2432 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2432 target genes. The mRNA of each one of this plurality of GAM2432 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2432 RNA, herein designated GAM RNA, and which when bound by GAM2432 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2432 target proteins.

[33928] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2432 gene, herein designated GAM GENE, on one or more GAM2432 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33929] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2432 correlate with, and may be deduced from, the identity of the target genes which GAM2432 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33930] Nucleotide sequences of the GAM2432 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2432 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2432 are further described hereinbelow with reference to Table 1.

[33931] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2432 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33932] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2433 (GAM2433) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33933] GAM2433 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2433 was detected is described hereinabove with reference to Figs. 2-8.

[33934] GAM2433 gene, herein designated GAM GENE, and GAM2433 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33935] GAM2433 gene, herein designated GAM GENE, encodes a GAM2433 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2433 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2433 precursor RNA is designated SEQ ID:2410, and is provided hereinbelow with reference to the sequence listing part.

[33936] GAM2433 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [33937] An enzyme complex designated DICER COMPLEX, dices the GAM2433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2433 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2433 RNA is designated SEQ ID:5024, and is provided hereinbelow with reference to the sequence listing part.
- [33938] GAM2433 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2433 target RNA, herein designated GAM TARGET RNA. GAM2433 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [33939] GAM2433 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2433 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2433 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2433 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2433 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33940] The complementary binding of GAM2433 RNA, herein designated GAM RNA, to target binding sites on GAM2433 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2433 target RNA, herein designated GAM TARGET RNA, into GAM2433 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33941] It is appreciated that GAM2433 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2433 target genes. The mRNA of each one of this plurality of GAM2433 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2433 RNA, herein designated GAM RNA, and which when bound by GAM2433 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2433 target proteins.

[33942] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2433 gene, herein designated GAM GENE, on one or more GAM2433 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33943] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2433 correlate with, and may be deduced from, the identity of the target genes which GAM2433 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33944] Nucleotide sequences of the GAM2433 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2433 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2433 are further described hereinbelow with reference to Table 1.

[33945] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2433 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [33946] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2434 (GAM2434) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [33947] GAM2434 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2434 was detected is described hereinabove with reference to Figs. 2-8.
- [33948] GAM2434 gene, herein designated GAM GENE, and GAM2434 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [33949] GAM2434 gene, herein designated GAM GENE, encodes a GAM2434 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2434 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2434 precursor RNA is designated SEQ ID:2411, and is provided hereinbelow with reference to the sequence listing part.
- [33950] GAM2434 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33951] An enzyme complex designated DICER COMPLEX, dices the GAM2434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2434 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2434 RNA is designated SEQ ID:5025, and is provided hereinbelow with reference to the sequence listing part.

[33952] GAM2434 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2434 target RNA, herein designated GAM TARGET RNA. GAM2434 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33953] GAM2434 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2434 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2434 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2434 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2434 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33954] The complementary binding of GAM2434 RNA, herein designated GAM RNA, to target binding sites on GAM2434 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2434 target RNA, herein designated GAM TARGET RNA, into GAM2434 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33955] It is appreciated that GAM2434 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2434 target genes. The mRNA of each one of this plurality of GAM2434 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2434 RNA, herein designated GAM RNA, and which when bound by GAM2434 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2434 target proteins.

[33956] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2434 gene, herein designated GAM GENE, on one or more GAM2434 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33957] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2434 correlate with, and may be deduced from, the identity of the target genes which GAM2434 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33958] Nucleotide sequences of the GAM2434 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2434 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2434 are further described hereinbelow with reference to Table 1.

- [33959] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2434 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [33960] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2435 (GAM2435) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [33961] GAM2435 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2435 was detected is described hereinabove with reference to Figs. 2-8.
- [33962] GAM2435 gene, herein designated GAM GENE, and GAM2435 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [33963] GAM2435 gene, herein designated GAM GENE, encodes a GAM2435 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2435 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2435 precursor RNA is designated SEQ ID:2412, and is provided hereinbelow with reference to the sequence listing part.

[33964] GAM2435 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33965] An enzyme complex designated DICER COMPLEX, dices the GAM2435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2435 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2435 RNA is designated SEQ ID:5026, and is provided hereinbelow with reference to the sequence listing part.

[33966] GAM2435 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2435 target RNA, herein designated GAM TARGET RNA. GAM2435 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33967] GAM2435 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2435 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2435 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2435 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2435 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33968] The complementary binding of GAM2435 RNA, herein designated GAM RNA, to target binding sites on GAM2435 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2435 target RNA, herein designated GAM TARGET RNA, into GAM2435 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33969] It is appreciated that GAM2435 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2435 target genes. The

mRNA of each one of this plurality of GAM2435 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2435 RNA, herein designated GAM RNA, and which when bound by GAM2435 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2435 target proteins.

[33970] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2435 gene, herein designated GAM GENE, on one or more GAM2435 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33971] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2435 correlate with, and may be deduced from, the identity of the target genes which GAM2435 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33972] Nucleotide sequences of the GAM2435 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2435 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2435 are further described hereinbelow with reference to Table 1.

[33973] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2435 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33974] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2436 (GAM2436) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33975] GAM2436 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2436 was detected is described hereinabove with reference to Figs. 2-8.

[33976] GAM2436 gene, herein designated GAM GENE, and GAM2436 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[33977] GAM2436 gene, herein designated GAM GENE, encodes a GAM2436 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2436 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2436 precursor RNA is designated SEQ ID:2413, and is provided hereinbelow with reference to the sequence listing part.

[33978] GAM2436 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2436 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33979] An enzyme complex designated DICER COMPLEX, dices the GAM2436 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2436 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2436 RNA is designated SEQ ID:5027, and is provided hereinbelow with reference to the sequence listing part.

[33980] GAM2436 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2436 target RNA, herein designated GAM TARGET RNA. GAM2436 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33981] GAM2436 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2436 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2436 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2436 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2436 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33982] The complementary binding of GAM2436 RNA, herein designated GAM RNA, to target binding sites on GAM2436 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2436 target RNA, herein designated GAM TARGET RNA, into GAM2436 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33983] It is appreciated that GAM2436 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2436 target genes. The mRNA of each one of this plurality of GAM2436 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2436 RNA, herein designated GAM RNA, and which when bound by GAM2436 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2436 target proteins.

[33984] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2436 gene, herein designated GAM GENE, on one or more GAM2436 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33985] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2436 correlate with, and may be deduced from, the identity of the target

genes which GAM2436 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33986] Nucleotide sequences of the GAM2436 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2436 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2436 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2436 are further described hereinbelow with reference to Table 1.

[33987] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2436 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[33988] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2437 (GAM2437) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[33989] GAM2437 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2437 was detected is described hereinabove with reference to Figs. 2-8.

[33990] GAM2437 gene, herein designated GAM GENE, and GAM2437 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[33991] GAM2437 gene, herein designated GAM GENE, encodes a GAM2437 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2437 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2437 precursor RNA is designated SEQ ID:2414, and is provided hereinbelow with reference to the sequence listing part.

[33992] GAM2437 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33993] An enzyme complex designated DICER COMPLEX, dices the GAM2437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2437 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2437 RNA is designated SEQ ID:5028, and is provided

hereinbelow with reference to the sequence listing part.

[33994] GAM2437 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2437 target RNA, herein designated GAM TARGET RNA. GAM2437 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33995] GAM2437 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2437 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2437 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2437 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2437 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33996] The complementary binding of GAM2437 RNA, herein designated GAM RNA, to target binding sites on GAM2437 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2437 target RNA, herein designated GAM TARGET RNA, into GAM2437 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[33997] It is appreciated that GAM2437 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2437 target genes. The mRNA of each one of this plurality of GAM2437 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2437 RNA, herein designated GAM RNA, and which when bound by GAM2437 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2437 target proteins.

[33998] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2437 gene, herein designated GAM GENE, on one or more GAM2437 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33999] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2437 correlate with, and may be deduced from, the identity of the target genes which GAM2437 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34000] Nucleotide sequences of the GAM2437 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2437 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2437 are further described hereinbelow with reference to Table 1.

[34001] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2437 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34002] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2438 (GAM2438) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34003] GAM2438 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2438 was detected is described hereinabove with reference to Figs. 2-8.

[34004] GAM2438 gene, herein designated GAM GENE, and GAM2438 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34005] GAM2438 gene, herein designated GAM GENE, encodes a GAM2438 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2438 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2438 precursor RNA is designated SEQ ID:2415, and is provided hereinbelow with reference to the sequence listing part.

[34006] GAM2438 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34007] An enzyme complex designated DICER COMPLEX, dices the GAM2438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2438 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2438 RNA is designated SEQ ID:5029, and is provided hereinbelow with reference to the sequence listing part.

[34008] GAM2438 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2438 target RNA, herein designated GAM TARGET RNA. GAM2438 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34009] GAM2438 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2438 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2438 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2438 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2438 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34010] The complementary binding of GAM2438 RNA, herein designated GAM RNA, to target binding sites on GAM2438 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2438 target RNA, herein designated GAM TARGET RNA, into GAM2438 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34011] It is appreciated that GAM2438 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2438 target genes. The mRNA of each one of this plurality of GAM2438 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2438 RNA, herein designated GAM RNA, and which when bound by GAM2438 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2438 target proteins.

[34012] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2438 gene, herein designated GAM GENE, on one or more GAM2438 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34013] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2438 correlate with, and may be deduced from, the identity of the target genes which GAM2438 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34014] Nucleotide sequences of the GAM2438 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2438 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2438 are further described hereinbelow with reference to Table 1.

[34015] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2438 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34016] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2439 (GAM2439) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34017] GAM2439 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2439 was detected is described hereinabove with reference to Figs. 2-8.

[34018] GAM2439 gene, herein designated GAM GENE, and GAM2439 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34019] GAM2439 gene, herein designated GAM GENE, encodes a GAM2439 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2439 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2439 precursor RNA is designated SEQ ID:2416, and is provided hereinbelow with reference to the sequence listing part.

[34020] GAM2439 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [34021] An enzyme complex designated DICER COMPLEX, dices the GAM2439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2439 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2439 RNA is designated SEQ ID:5030, and is provided hereinbelow with reference to the sequence listing part.
- [34022] GAM2439 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2439 target RNA, herein designated GAM TARGET RNA. GAM2439 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [34023] GAM2439 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2439 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2439 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2439 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2439 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34024] The complementary binding of GAM2439 RNA, herein designated GAM RNA, to target binding sites on GAM2439 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2439 target RNA, herein designated GAM TARGET RNA, into GAM2439 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34025] It is appreciated that GAM2439 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2439 target genes. The mRNA of each one of this plurality of GAM2439 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2439 RNA, herein designated GAM RNA, and which when bound by GAM2439 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2439 target proteins.

[34026] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2439 gene, herein designated GAM GENE, on one or more GAM2439 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34027] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2439 correlate with, and may be deduced from, the identity of the target genes which GAM2439 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34028] Nucleotide sequences of the GAM2439 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2439 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2439 are further described hereinbelow with reference to Table 1.

[34029] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2439 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[34030] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2440 (GAM2440) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34031] GAM2440 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2440 was detected is described hereinabove with reference to Figs. 2-8.

[34032] GAM2440 gene, herein designated GAM GENE, and GAM2440 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34033] GAM2440 gene, herein designated GAM GENE, encodes a GAM2440 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2440 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2440 precursor RNA is designated SEQ ID:2417, and is provided hereinbelow with reference to the sequence listing part.

[34034] GAM2440 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34035] An enzyme complex designated DICER COMPLEX, dices the GAM2440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2440 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2440 RNA is designated SEQ ID:5031, and is provided hereinbelow with reference to the sequence listing part.

[34036] GAM2440 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2440 target RNA, herein designated GAM TARGET RNA. GAM2440 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34037] GAM2440 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2440 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2440 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2440 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2440 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34038] The complementary binding of GAM2440 RNA, herein designated GAM RNA, to target binding sites on GAM2440 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2440 target RNA, herein designated GAM TARGET RNA, into GAM2440 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34039] It is appreciated that GAM2440 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2440 target genes. The mRNA of each one of this plurality of GAM2440 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2440 RNA, herein designated GAM RNA, and which when bound by GAM2440 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2440 target proteins.

[34040] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2440 gene, herein designated GAM GENE, on one or more GAM2440 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34041] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2440 correlate with, and may be deduced from, the identity of the target genes which GAM2440 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34042] Nucleotide sequences of the GAM2440 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2440 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2440 are further described hereinbelow with reference to Table 1.

[34043] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2440 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34044] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2441 (GAM2441) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34045] GAM2441 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2441 was detected is described hereinabove with reference to Figs. 2-8.

[34046] GAM2441 gene, herein designated GAM GENE, and GAM2441 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34047] GAM2441 gene, herein designated GAM GENE, encodes a GAM2441 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2441 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2441 precursor RNA is designated SEQ ID:2418, and is provided hereinbelow with reference to the sequence listing part.

[34048] GAM2441 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34049] An enzyme complex designated DICER COMPLEX, dices the GAM2441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2441 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2441 RNA is designated SEQ ID:5032, and is provided hereinbelow with reference to the sequence listing part.

[34050] GAM2441 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2441 target RNA, herein designated GAM TARGET RNA. GAM2441 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34051] GAM2441 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2441 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2441 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2441 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2441 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34052] The complementary binding of GAM2441 RNA, herein designated GAM RNA, to target binding sites on GAM2441 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2441 target RNA, herein designated GAM TARGET RNA, into GAM2441 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34053] It is appreciated that GAM2441 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2441 target genes. The

mRNA of each one of this plurality of GAM2441 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2441 RNA, herein designated GAM RNA, and which when bound by GAM2441 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2441 target proteins.

[34054] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2441 gene, herein designated GAM GENE, on one or more GAM2441 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34055] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2441 correlate with, and may be deduced from, the identity of the target genes which GAM2441 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34056] Nucleotide sequences of the GAM2441 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2441 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2441 are further described hereinbelow with reference to Table 1.

[34057] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2441 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34058] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2442 (GAM2442) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34059] GAM2442 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2442 was detected is described hereinabove with reference to Figs. 2-8.

[34060] GAM2442 gene, herein designated GAM GENE, and GAM2442 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34061] GAM2442 gene, herein designated GAM GENE, encodes a GAM2442 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2442 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2442 precursor RNA is designated SEQ ID:2419, and is provided hereinbelow with reference to the sequence listing part.

[34062] GAM2442 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34063] An enzyme complex designated DICER COMPLEX, dices the GAM2442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2442 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2442 RNA is designated SEQ ID:5033, and is provided hereinbelow with reference to the sequence listing part.

[34064] GAM2442 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2442 target RNA, herein designated GAM TARGET RNA. GAM2442 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34065] GAM2442 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2442 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2442 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2442 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2442 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34066] The complementary binding of GAM2442 RNA, herein designated GAM RNA, to target binding sites on GAM2442 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2442 target RNA, herein designated GAM TARGET RNA, into GAM2442 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34067] It is appreciated that GAM2442 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2442 target genes. The mRNA of each one of this plurality of GAM2442 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2442 RNA, herein designated GAM RNA, and which when bound by GAM2442 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2442 target proteins.

[34068] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2442 gene, herein designated GAM GENE, on one or more GAM2442 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34069] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2442 correlate with, and may be deduced from, the identity of the target

genes which GAM2442 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34070] Nucleotide sequences of the GAM2442 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2442 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2442 are further described hereinbelow with reference to Table 1.

[34071] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2442 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34072] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2443 (GAM2443) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34073] GAM2443 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2443 was detected is described hereinabove with reference to Figs. 2-8.

[34074] GAM2443 gene, herein designated GAM GENE, and GAM2443 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[34075] GAM2443 gene, herein designated GAM GENE, encodes a GAM2443 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2443 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2443 precursor RNA is designated SEQ ID:2420, and is provided hereinbelow with reference to the sequence listing part.

[34076] GAM2443 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34077] An enzyme complex designated DICER COMPLEX, dices the GAM2443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2443 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2443 RNA is designated SEQ ID:5034, and is provided

hereinbelow with reference to the sequence listing part.

[34078] GAM2443 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2443 target RNA, herein designated GAM TARGET RNA. GAM2443 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34079] GAM2443 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2443 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2443 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2443 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2443 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34080] The complementary binding of GAM2443 RNA, herein designated GAM RNA, to target binding sites on GAM2443 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2443 target RNA, herein designated GAM TARGET RNA, into GAM2443 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34081] It is appreciated that GAM2443 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2443 target genes. The mRNA of each one of this plurality of GAM2443 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2443 RNA, herein designated GAM RNA, and which when bound by GAM2443 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2443 target proteins.

[34082] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2443 gene, herein designated GAM GENE, on one or more GAM2443 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34083] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2443 correlate with, and may be deduced from, the identity of the target genes which GAM2443 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34084] Nucleotide sequences of the GAM2443 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2443 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2443 are further described hereinbelow with reference to Table 1.

[34085] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2443 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34086] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2444 (GAM2444) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34087] GAM2444 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2444 was detected is described hereinabove with reference to Figs. 2-8.

[34088] GAM2444 gene, herein designated GAM GENE, and GAM2444 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34089] GAM2444 gene, herein designated GAM GENE, encodes a GAM2444 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2444 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2444 precursor RNA is designated SEQ ID:2421, and is provided hereinbelow with reference to the sequence listing part.

[34090] GAM2444 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34091] An enzyme complex designated DICER COMPLEX, dices the GAM2444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2444 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2444 RNA is designated SEQ ID:5035, and is provided hereinbelow with reference to the sequence listing part.

[34092] GAM2444 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2444 target RNA, herein designated GAM TARGET RNA. GAM2444 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34093] GAM2444 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2444 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2444 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2444 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2444 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34094] The complementary binding of GAM2444 RNA, herein designated GAM RNA, to target binding sites on GAM2444 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2444 target RNA, herein designated GAM TARGET RNA, into GAM2444 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34095] It is appreciated that GAM2444 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2444 target genes. The mRNA of each one of this plurality of GAM2444 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2444 RNA, herein designated GAM RNA, and which when bound by GAM2444 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2444 target proteins.

[34096] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2444 gene, herein designated GAM GENE, on one or more GAM2444 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34097] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2444 correlate with, and may be deduced from, the identity of the target genes which GAM2444 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34098] Nucleotide sequences of the GAM2444 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2444 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2444 are further described hereinbelow with reference to Table 1.

[34099] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2444 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34100] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2445 (GAM2445) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [34101] GAM2445 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2445 was detected is described hereinabove with reference to Figs. 2-8.
- [34102] GAM2445 gene, herein designated GAM GENE, and GAM2445 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34103] GAM2445 gene, herein designated GAM GENE, encodes a GAM2445 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2445 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2445 precursor RNA is designated SEQ ID:2422, and is provided hereinbelow with reference to the sequence listing part.
- [34104] GAM2445 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [34105] An enzyme complex designated DICER COMPLEX, dices the GAM2445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2445 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2445 RNA is designated SEQ ID:5037, and is provided hereinbelow with reference to the sequence listing part.
- [34106] GAM2445 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2445 target RNA, herein designated GAM TARGET RNA. GAM2445 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [34107] GAM2445 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2445 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2445 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2445 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2445 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34108] The complementary binding of GAM2445 RNA, herein designated GAM RNA, to target binding sites on GAM2445 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2445 target RNA, herein designated GAM TARGET RNA, into GAM2445 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34109] It is appreciated that GAM2445 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2445 target genes. The mRNA of each one of this plurality of GAM2445 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2445 RNA, herein designated GAM RNA, and which when bound by GAM2445 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2445 target proteins.

[34110] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2445 gene, herein designated GAM GENE, on one or more GAM2445 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34111] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2445 correlate with, and may be deduced from, the identity of the target genes which GAM2445 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34112] Nucleotide sequences of the GAM2445 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2445 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2445 are further described hereinbelow with reference to Table 1.

[34113] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2445 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [34114] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2446 (GAM2446) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [34115] GAM2446 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2446 was detected is described hereinabove with reference to Figs. 2-8.
- [34116] GAM2446 gene, herein designated GAM GENE, and GAM2446 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34117] GAM2446 gene, herein designated GAM GENE, encodes a GAM2446 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2446 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2446 precursor RNA is designated SEQ ID:2423, and is provided hereinbelow with reference to the sequence listing part.
- [34118] GAM2446 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34119] An enzyme complex designated DICER COMPLEX, dices the GAM2446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2446 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2446 RNA is designated SEQ ID:5036, and is provided hereinbelow with reference to the sequence listing part.

[34120] GAM2446 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2446 target RNA, herein designated GAM TARGET RNA. GAM2446 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34121] GAM2446 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2446 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2446 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2446 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2446 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34122] The complementary binding of GAM2446 RNA, herein designated GAM RNA, to target binding sites on GAM2446 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2446 target RNA, herein designated GAM TARGET RNA, into GAM2446 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34123] It is appreciated that GAM2446 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2446 target genes. The mRNA of each one of this plurality of GAM2446 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2446 RNA, herein designated GAM RNA, and which when bound by GAM2446 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2446 target proteins.

[34124] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2446 gene, herein designated GAM GENE, on one or more GAM2446 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34125] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2446 correlate with, and may be deduced from, the identity of the target genes which GAM2446 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34126] Nucleotide sequences of the GAM2446 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2446 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2446 are further described hereinbelow with reference to Table 1.

- [34127] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2446 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [34128] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2447 (GAM2447) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [34129] GAM2447 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2447 was detected is described hereinabove with reference to Figs. 2-8.
- [34130] GAM2447 gene, herein designated GAM GENE, and GAM2447 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34131] GAM2447 gene, herein designated GAM GENE, encodes a GAM2447 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2447 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2447 precursor RNA is designated SEQ ID:2424, and is provided hereinbelow with reference to the sequence listing part.

[34132] GAM2447 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34133] An enzyme complex designated DICER COMPLEX, dices the GAM2447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2447 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2447 RNA is designated SEQ ID:5038, and is provided hereinbelow with reference to the sequence listing part.

[34134] GAM2447 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2447 target RNA, herein designated GAM TARGET RNA. GAM2447 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34135] GAM2447 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2447 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2447 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2447 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2447 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34136] The complementary binding of GAM2447 RNA, herein designated GAM RNA, to target binding sites on GAM2447 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2447 target RNA, herein designated GAM TARGET RNA, into GAM2447 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34137] It is appreciated that GAM2447 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2447 target genes. The

mRNA of each one of this plurality of GAM2447 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2447 RNA, herein designated GAM RNA, and which when bound by GAM2447 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2447 target proteins.

[34138] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2447 gene, herein designated GAM GENE, on one or more GAM2447 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34139] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2447 correlate with, and may be deduced from, the identity of the target genes which GAM2447 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34140] Nucleotide sequences of the GAM2447 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2447 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2447 are further described hereinbelow with reference to Table 1.

[34141] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2447 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34142] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2448 (GAM2448) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34143] GAM2448 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2448 was detected is described hereinabove with reference to Figs. 2-8.

[34144] GAM2448 gene, herein designated GAM GENE, and GAM2448 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34145] GAM2448 gene, herein designated GAM GENE, encodes a GAM2448 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2448 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2448 precursor RNA is designated SEQ ID:2425, and is provided hereinbelow with reference to the sequence listing part.

[34146] GAM2448 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34147] An enzyme complex designated DICER COMPLEX, dices the GAM2448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2448 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2448 RNA is designated SEQ ID:5039, and is provided hereinbelow with reference to the sequence listing part.

[34148] GAM2448 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2448 target RNA, herein designated GAM TARGET RNA. GAM2448 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34149] GAM2448 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2448 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2448 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2448 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2448 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34150] The complementary binding of GAM2448 RNA, herein designated GAM RNA, to target binding sites on GAM2448 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2448 target RNA, herein designated GAM TARGET RNA, into GAM2448 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34151] It is appreciated that GAM2448 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2448 target genes. The mRNA of each one of this plurality of GAM2448 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2448 RNA, herein designated GAM RNA, and which when bound by GAM2448 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2448 target proteins.

[34152] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2448 gene, herein designated GAM GENE, on one or more GAM2448 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34153] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2448 correlate with, and may be deduced from, the identity of the target

genes which GAM2448 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34154] Nucleotide sequences of the GAM2448 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2448 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2448 are further described hereinbelow with reference to Table 1.

[34155] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2448 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34156] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2449 (GAM2449) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34157] GAM2449 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2449 was detected is described hereinabove with reference to Figs. 2-8.

[34158] GAM2449 gene, herein designated GAM GENE, and GAM2449 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

- [34159] GAM2449 gene, herein designated GAM GENE, encodes a GAM2449 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2449 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2449 precursor RNA is designated SEQ ID:2426, and is provided hereinbelow with reference to the sequence listing part.
- [34160] GAM2449 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [34161] An enzyme complex designated DICER COMPLEX, dices the GAM2449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2449 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2449 RNA is designated SEQ ID:5040, and is provided

hereinbelow with reference to the sequence listing part.

[34162] GAM2449 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2449 target RNA, herein designated GAM TARGET RNA. GAM2449 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34163] GAM2449 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2449 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2449 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2449 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2449 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34164] The complementary binding of GAM2449 RNA, herein designated GAM RNA, to target binding sites on GAM2449 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2449 target RNA, herein designated GAM TARGET RNA, into GAM2449 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34165] It is appreciated that GAM2449 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2449 target genes. The mRNA of each one of this plurality of GAM2449 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2449 RNA, herein designated GAM RNA, and which when bound by GAM2449 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2449 target proteins.

[34166] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2449 gene, herein designated GAM GENE, on one or more GAM2449 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34167] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2449 correlate with, and may be deduced from, the identity of the target genes which GAM2449 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34168] Nucleotide sequences of the GAM2449 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2449 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2449 are further described hereinbelow with reference to Table 1.

[34169] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2449 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34170] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2450 (GAM2450) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34171] GAM2450 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2450 was detected is described hereinabove with reference to Figs. 2-8.

[34172] GAM2450 gene, herein designated GAM GENE, and GAM2450 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34173] GAM2450 gene, herein designated GAM GENE, encodes a GAM2450 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2450 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2450 precursor RNA is designated SEQ ID:2427, and is provided hereinbelow with reference to the sequence listing part.

[34174] GAM2450 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34175] An enzyme complex designated DICER COMPLEX, dices the GAM2450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2450 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2450 RNA is designated SEQ ID:5041, and is provided hereinbelow with reference to the sequence listing part.

[34176] GAM2450 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2450 target RNA, herein designated GAM TARGET RNA. GAM2450 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34177] GAM2450 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2450 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2450 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2450 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2450 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34178] The complementary binding of GAM2450 RNA, herein designated GAM RNA, to target binding sites on GAM2450 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2450 target RNA, herein designated GAM TARGET RNA, into GAM2450 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34179] It is appreciated that GAM2450 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2450 target genes. The mRNA of each one of this plurality of GAM2450 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2450 RNA, herein designated GAM RNA, and which when bound by GAM2450 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2450 target proteins.

[34180] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2450 gene, herein designated GAM GENE, on one or more GAM2450 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34181] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2450 correlate with, and may be deduced from, the identity of the target genes which GAM2450 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34182] Nucleotide sequences of the GAM2450 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2450 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2450 are further described hereinbelow with reference to Table 1.

[34183] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2450 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34184] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2451 (GAM2451) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [34185] GAM2451 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2451 was detected is described hereinabove with reference to Figs. 2-8.
- [34186] GAM2451 gene, herein designated GAM GENE, and GAM2451 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34187] GAM2451 gene, herein designated GAM GENE, encodes a GAM2451 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2451 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2451 precursor RNA is designated SEQ ID:2428, and is provided hereinbelow with reference to the sequence listing part.
- [34188] GAM2451 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [34189] An enzyme complex designated DICER COMPLEX, dices the GAM2451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2451 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2451 RNA is designated SEQ ID:5042, and is provided hereinbelow with reference to the sequence listing part.
- [34190] GAM2451 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2451 target RNA, herein designated GAM TARGET RNA. GAM2451 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [34191] GAM2451 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2451 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2451 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2451 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2451 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34192] The complementary binding of GAM2451 RNA, herein designated GAM RNA, to target binding sites on GAM2451 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2451 target RNA, herein designated GAM TARGET RNA, into GAM2451 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34193] It is appreciated that GAM2451 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2451 target genes. The mRNA of each one of this plurality of GAM2451 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2451 RNA, herein designated GAM RNA, and which when bound by GAM2451 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2451 target proteins.

[34194] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2451 gene, herein designated GAM GENE, on one or more GAM2451 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34195] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2451 correlate with, and may be deduced from, the identity of the target genes which GAM2451 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34196] Nucleotide sequences of the GAM2451 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2451 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2451 are further described hereinbelow with reference to Table 1.

[34197] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2451 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[34198] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2452 (GAM2452) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34199] GAM2452 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2452 was detected is described hereinabove with reference to Figs. 2-8.

[34200] GAM2452 gene, herein designated GAM GENE, and GAM2452 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34201] GAM2452 gene, herein designated GAM GENE, encodes a GAM2452 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2452 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2452 precursor RNA is designated SEQ ID:2429, and is provided hereinbelow with reference to the sequence listing part.

[34202] GAM2452 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34203] An enzyme complex designated DICER COMPLEX, dices the GAM2452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2452 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2452 RNA is designated SEQ ID:5043, and is provided hereinbelow with reference to the sequence listing part.

[34204] GAM2452 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2452 target RNA, herein designated GAM TARGET RNA. GAM2452 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34205] GAM2452 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2452 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2452 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2452 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2452 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34206] The complementary binding of GAM2452 RNA, herein designated GAM RNA, to target binding sites on GAM2452 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2452 target RNA, herein designated GAM TARGET RNA, into GAM2452 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34207] It is appreciated that GAM2452 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2452 target genes. The mRNA of each one of this plurality of GAM2452 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2452 RNA, herein designated GAM RNA, and which when bound by GAM2452 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2452 target proteins.

[34208] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2452 gene, herein designated GAM GENE, on one or more GAM2452 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34209] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2452 correlate with, and may be deduced from, the identity of the target genes which GAM2452 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34210] Nucleotide sequences of the GAM2452 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2452 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2452 are further described hereinbelow with reference to Table 1.

- [34211] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2452 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [34212] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2453 (GAM2453) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [34213] GAM2453 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2453 was detected is described hereinabove with reference to Figs. 2-8.
- [34214] GAM2453 gene, herein designated GAM GENE, and GAM2453 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34215] GAM2453 gene, herein designated GAM GENE, encodes a GAM2453 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2453 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2453 precursor RNA is designated SEQ ID:2430, and is provided hereinbelow with reference to the sequence listing part.

[34216] GAM2453 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34217] An enzyme complex designated DICER COMPLEX, dices the GAM2453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2453 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2453 RNA is designated SEQ ID:5044, and is provided hereinbelow with reference to the sequence listing part.

[34218] GAM2453 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2453 target RNA, herein designated GAM TARGET RNA. GAM2453 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34219] GAM2453 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2453 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2453 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2453 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2453 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34220] The complementary binding of GAM2453 RNA, herein designated GAM RNA, to target binding sites on GAM2453 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2453 target RNA, herein designated GAM TARGET RNA, into GAM2453 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34221] It is appreciated that GAM2453 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2453 target genes. The

mRNA of each one of this plurality of GAM2453 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2453 RNA, herein designated GAM RNA, and which when bound by GAM2453 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2453 target proteins.

[34222] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2453 gene, herein designated GAM GENE, on one or more GAM2453 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34223] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2453 correlate with, and may be deduced from, the identity of the target genes which GAM2453 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34224] Nucleotide sequences of the GAM2453 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2453 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2453 are further described hereinbelow with reference to Table 1.

[34225] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2453 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34226] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2454 (GAM2454) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34227] GAM2454 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2454 was detected is described hereinabove with reference to Figs. 2-8.

[34228] GAM2454 gene, herein designated GAM GENE, and GAM2454 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34229] GAM2454 gene, herein designated GAM GENE, encodes a GAM2454 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2454 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2454 precursor RNA is designated SEQ ID:2431, and is provided hereinbelow with reference to the sequence listing part.

[34230] GAM2454 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34231] An enzyme complex designated DICER COMPLEX, dices the GAM2454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2454 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2454 RNA is designated SEQ ID:5045, and is provided hereinbelow with reference to the sequence listing part.

[34232] GAM2454 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2454 target RNA, herein designated GAM TARGET RNA. GAM2454 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34233] GAM2454 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2454 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2454 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2454 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2454 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34234] The complementary binding of GAM2454 RNA, herein designated GAM RNA, to target binding sites on GAM2454 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2454 target RNA, herein designated GAM TARGET RNA, into GAM2454 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34235] It is appreciated that GAM2454 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2454 target genes. The mRNA of each one of this plurality of GAM2454 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2454 RNA, herein designated GAM RNA, and which when bound by GAM2454 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2454 target proteins.

[34236] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2454 gene, herein designated GAM GENE, on one or more GAM2454 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34237] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2454 correlate with, and may be deduced from, the identity of the target

genes which GAM2454 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34238] Nucleotide sequences of the GAM2454 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2454 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2454 are further described hereinbelow with reference to Table 1.

[34239] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2454 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34240] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2455 (GAM2455) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34241] GAM2455 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2455 was detected is described hereinabove with reference to Figs. 2-8.

[34242] GAM2455 gene, herein designated GAM GENE, and GAM2455 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[34243] GAM2455 gene, herein designated GAM GENE, encodes a GAM2455 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2455 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2455 precursor RNA is designated SEQ ID:2432, and is provided hereinbelow with reference to the sequence listing part.

[34244] GAM2455 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2455 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34245] An enzyme complex designated DICER COMPLEX, dices the GAM2455 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2455 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2455 RNA is designated SEQ ID:5046, and is provided

hereinbelow with reference to the sequence listing part.

[34246] GAM2455 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2455 target RNA, herein designated GAM TARGET RNA. GAM2455 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34247] GAM2455 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2455 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2455 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2455 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2455 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34248] The complementary binding of GAM2455 RNA, herein designated GAM RNA, to target binding sites on GAM2455 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2455 target RNA, herein designated GAM TARGET RNA, into GAM2455 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34249] It is appreciated that GAM2455 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2455 target genes. The mRNA of each one of this plurality of GAM2455 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2455 RNA, herein designated GAM RNA, and which when bound by GAM2455 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2455 target proteins.

[34250] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2455 gene, herein designated GAM GENE, on one or more GAM2455 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34251] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2455 correlate with, and may be deduced from, the identity of the target genes which GAM2455 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34252] Nucleotide sequences of the GAM2455 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2455 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2455 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2455 are further described hereinbelow with reference to Table 1.

[34253] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2455 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34254] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2456 (GAM2456) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34255] GAM2456 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2456 was detected is described hereinabove with reference to Figs. 2-8.

[34256] GAM2456 gene, herein designated GAM GENE, and GAM2456 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34257] GAM2456 gene, herein designated GAM GENE, encodes a GAM2456 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2456 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2456 precursor RNA is designated SEQ ID:2433, and is provided hereinbelow with reference to the sequence listing part.

[34258] GAM2456 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34259] An enzyme complex designated DICER COMPLEX, dices the GAM2456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2456 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM2456 RNA is designated SEQ ID:5047, and is provided hereinbelow with reference to the sequence listing part.

[34260] GAM2456 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2456 target RNA, herein designated GAM TARGET RNA. GAM2456 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34261] GAM2456 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2456 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2456 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2456 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2456 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34262] The complementary binding of GAM2456 RNA, herein designated GAM RNA, to target binding sites on GAM2456 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2456 target RNA, herein designated GAM TARGET RNA, into GAM2456 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34263] It is appreciated that GAM2456 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2456 target genes. The mRNA of each one of this plurality of GAM2456 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2456 RNA, herein designated GAM RNA, and which when bound by GAM2456 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2456 target proteins.

[34264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2456 gene, herein designated GAM GENE, on one or more GAM2456 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34265] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2456 correlate with, and may be deduced from, the identity of the target genes which GAM2456 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34266] Nucleotide sequences of the GAM2456 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2456 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2456 are further described hereinbelow with reference to Table 1.

[34267] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2456 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34268] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2457 (GAM2457) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34269] GAM2457 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2457 was detected is described hereinabove with reference to Figs. 2-8.

[34270] GAM2457 gene, herein designated GAM GENE, and GAM2457 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34271] GAM2457 gene, herein designated GAM GENE, encodes a GAM2457 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2457 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2457 precursor RNA is designated SEQ ID:2434, and is provided hereinbelow with reference to the sequence listing part.

[34272] GAM2457 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [34273] An enzyme complex designated DICER COMPLEX, dices the GAM2457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2457 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2457 RNA is designated SEQ ID:5048, and is provided hereinbelow with reference to the sequence listing part.
- [34274] GAM2457 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2457 target RNA, herein designated GAM TARGET RNA. GAM2457 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [34275] GAM2457 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2457 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2457 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2457 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2457 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34276] The complementary binding of GAM2457 RNA, herein designated GAM RNA, to target binding sites on GAM2457 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2457 target RNA, herein designated GAM TARGET RNA, into GAM2457 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34277] It is appreciated that GAM2457 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2457 target genes. The mRNA of each one of this plurality of GAM2457 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2457 RNA, herein designated GAM RNA, and which when bound by GAM2457 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2457 target proteins.

[34278] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2457 gene, herein designated GAM GENE, on one or more GAM2457 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34279] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2457 correlate with, and may be deduced from, the identity of the target genes which GAM2457 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34280] Nucleotide sequences of the GAM2457 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2457 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2457 are further described hereinbelow with reference to Table 1.

[34281] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2457 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[34282] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2458 (GAM2458) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34283] GAM2458 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2458 was detected is described hereinabove with reference to Figs. 2-8.

[34284] GAM2458 gene, herein designated GAM GENE, and GAM2458 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34285] GAM2458 gene, herein designated GAM GENE, encodes a GAM2458 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2458 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2458 precursor RNA is designated SEQ ID:2435, and is provided hereinbelow with reference to the sequence listing part.

[34286] GAM2458 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34287] An enzyme complex designated DICER COMPLEX, dices the GAM2458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2458 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2458 RNA is designated SEQ ID:5049, and is provided hereinbelow with reference to the sequence listing part.

[34288] GAM2458 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2458 target RNA, herein designated GAM TARGET RNA. GAM2458 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34289] GAM2458 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2458 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2458 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2458 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2458 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34290] The complementary binding of GAM2458 RNA, herein designated GAM RNA, to target binding sites on GAM2458 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2458 target RNA, herein designated GAM TARGET RNA, into GAM2458 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34291] It is appreciated that GAM2458 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2458 target genes. The mRNA of each one of this plurality of GAM2458 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2458 RNA, herein designated GAM RNA, and which when bound by GAM2458 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2458 target proteins.

[34292] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2458 gene, herein designated GAM GENE, on one or more GAM2458 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34293] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2458 correlate with, and may be deduced from, the identity of the target genes which GAM2458 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34294] Nucleotide sequences of the GAM2458 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2458 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2458 are further described hereinbelow with reference to Table 1.

- [34295] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2458 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [34296] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2459 (GAM2459) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [34297] GAM2459 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2459 was detected is described hereinabove with reference to Figs. 2-8.
- [34298] GAM2459 gene, herein designated GAM GENE, and GAM2459 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34299] GAM2459 gene, herein designated GAM GENE, encodes a GAM2459 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2459 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2459 precursor RNA is designated SEQ ID:2436, and is provided hereinbelow with reference to the sequence listing part.

[34300] GAM2459 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34301] An enzyme complex designated DICER COMPLEX, dices the GAM2459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2459 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2459 RNA is designated SEQ ID:5050, and is provided hereinbelow with reference to the sequence listing part.

[34302] GAM2459 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2459 target RNA, herein designated GAM TARGET RNA. GAM2459 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34303] GAM2459 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2459 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2459 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2459 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2459 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34304] The complementary binding of GAM2459 RNA, herein designated GAM RNA, to target binding sites on GAM2459 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2459 target RNA, herein designated GAM TARGET RNA, into GAM2459 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34305] It is appreciated that GAM2459 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2459 target genes. The

mRNA of each one of this plurality of GAM2459 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2459 RNA, herein designated GAM RNA, and which when bound by GAM2459 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2459 target proteins.

[34306] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2459 gene, herein designated GAM GENE, on one or more GAM2459 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34307] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2459 correlate with, and may be deduced from, the identity of the target genes which GAM2459 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34308] Nucleotide sequences of the GAM2459 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2459 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2459 are further described hereinbelow with reference to Table 1.

[34309] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2459 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34310] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2460 (GAM2460) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34311] GAM2460 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2460 was detected is described hereinabove with reference to Figs. 2-8.

[34312] GAM2460 gene, herein designated GAM GENE, and GAM2460 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34313] GAM2460 gene, herein designated GAM GENE, encodes a GAM2460 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2460 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2460 precursor RNA is designated SEQ ID:2437, and is provided hereinbelow with reference to the sequence listing part.

[34314] GAM2460 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2460 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34315] An enzyme complex designated DICER COMPLEX, dices the GAM2460 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2460 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM2460 RNA is designated SEQ ID:5051, and is provided hereinbelow with reference to the sequence listing part.

[34316] GAM2460 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2460 target RNA, herein designated GAM TARGET RNA. GAM2460 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34317] GAM2460 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2460 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2460 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2460 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2460 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34318] The complementary binding of GAM2460 RNA, herein designated GAM RNA, to target binding sites on GAM2460 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2460 target RNA, herein designated GAM TARGET RNA, into GAM2460 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34319] It is appreciated that GAM2460 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2460 target genes. The mRNA of each one of this plurality of GAM2460 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2460 RNA, herein designated GAM RNA, and which when bound by GAM2460 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2460 target proteins.

[34320] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2460 gene, herein designated GAM GENE, on one or more GAM2460 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34321] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2460 correlate with, and may be deduced from, the identity of the target

genes which GAM2460 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34322] Nucleotide sequences of the GAM2460 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2460 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2460 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2460 are further described hereinbelow with reference to Table 1.

[34323] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2460 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34324] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2461 (GAM2461) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34325] GAM2461 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2461 was detected is described hereinabove with reference to Figs. 2-8.

[34326] GAM2461 gene, herein designated GAM GENE, and GAM2461 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[34327] GAM2461 gene, herein designated GAM GENE, encodes a GAM2461 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2461 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2461 precursor RNA is designated SEQ ID:2438, and is provided hereinbelow with reference to the sequence listing part.

[34328] GAM2461 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34329] An enzyme complex designated DICER COMPLEX, dices the GAM2461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2461 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2461 RNA is designated SEQ ID:5052, and is provided

hereinbelow with reference to the sequence listing part.

[34330] GAM2461 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2461 target RNA, herein designated GAM TARGET RNA. GAM2461 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34331] GAM2461 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2461 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2461 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2461 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2461 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34332] The complementary binding of GAM2461 RNA, herein designated GAM RNA, to target binding sites on GAM2461 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2461 target RNA, herein designated GAM TARGET RNA, into GAM2461 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34333] It is appreciated that GAM2461 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2461 target genes. The mRNA of each one of this plurality of GAM2461 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2461 RNA, herein designated GAM RNA, and which when bound by GAM2461 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2461 target proteins.

[34334] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2461 gene, herein designated GAM GENE, on one or more GAM2461 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34335] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2461 correlate with, and may be deduced from, the identity of the target genes which GAM2461 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34336] Nucleotide sequences of the GAM2461 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2461 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2461 are further described hereinbelow with reference to Table 1.

[34337] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2461 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34338] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2462 (GAM2462) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34339] GAM2462 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2462 was detected is described hereinabove with reference to Figs. 2-8.

[34340] GAM2462 gene, herein designated GAM GENE, and GAM2462 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34341] GAM2462 gene, herein designated GAM GENE, encodes a GAM2462 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2462 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2462 precursor RNA is designated SEQ ID:2439, and is provided hereinbelow with reference to the sequence listing part.

[34342] GAM2462 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34343] An enzyme complex designated DICER COMPLEX, dices the GAM2462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2462 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2462 RNA is designated SEQ ID:5054, and is provided hereinbelow with reference to the sequence listing part.

[34344] GAM2462 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2462 target RNA, herein designated GAM TARGET RNA. GAM2462 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34345] GAM2462 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2462 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2462 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2462 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2462 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34346] The complementary binding of GAM2462 RNA, herein designated GAM RNA, to target binding sites on GAM2462 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2462 target RNA, herein designated GAM TARGET RNA, into GAM2462 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34347] It is appreciated that GAM2462 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2462 target genes. The mRNA of each one of this plurality of GAM2462 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2462 RNA, herein designated GAM RNA, and which when bound by GAM2462 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2462 target proteins.

[34348] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2462 gene, herein designated GAM GENE, on one or more GAM2462 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34349] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2462 correlate with, and may be deduced from, the identity of the target genes which GAM2462 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34350] Nucleotide sequences of the GAM2462 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2462 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2462 are further described hereinbelow with reference to Table 1.

[34351] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2462 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34352] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2463 (GAM2463) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34353] GAM2463 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2463 was detected is described hereinabove with reference to Figs. 2-8.

[34354] GAM2463 gene, herein designated GAM GENE, and GAM2463 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34355] GAM2463 gene, herein designated GAM GENE, encodes a GAM2463 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2463 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2463 precursor RNA is designated SEQ ID:2440, and is provided hereinbelow with reference to the sequence listing part.

[34356] GAM2463 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [34357] An enzyme complex designated DICER COMPLEX, dices the GAM2463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2463 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2463 RNA is designated SEQ ID:5053, and is provided hereinbelow with reference to the sequence listing part.
- [34358] GAM2463 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2463 target RNA, herein designated GAM TARGET RNA. GAM2463 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [34359] GAM2463 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2463 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2463 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2463 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2463 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34360] The complementary binding of GAM2463 RNA, herein designated GAM RNA, to target binding sites on GAM2463 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2463 target RNA, herein designated GAM TARGET RNA, into GAM2463 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34361] It is appreciated that GAM2463 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2463 target genes. The mRNA of each one of this plurality of GAM2463 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2463 RNA, herein designated GAM RNA, and which when bound by GAM2463 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2463 target proteins.

[34362] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2463 gene, herein designated GAM GENE, on one or more GAM2463 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34363] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2463 correlate with, and may be deduced from, the identity of the target genes which GAM2463 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34364] Nucleotide sequences of the GAM2463 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2463 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2463 are further described hereinbelow with reference to Table 1.

[34365] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2463 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[34366] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2464 (GAM2464) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34367] GAM2464 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2464 was detected is described hereinabove with reference to Figs. 2-8.

[34368] GAM2464 gene, herein designated GAM GENE, and GAM2464 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34369] GAM2464 gene, herein designated GAM GENE, encodes a GAM2464 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2464 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2464 precursor RNA is designated SEQ ID:2441, and is provided hereinbelow with reference to the sequence listing part.

[34370] GAM2464 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34371] An enzyme complex designated DICER COMPLEX, dices the GAM2464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2464 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2464 RNA is designated SEQ ID:5055, and is provided hereinbelow with reference to the sequence listing part.

[34372] GAM2464 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2464 target RNA, herein designated GAM TARGET RNA. GAM2464 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34373] GAM2464 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2464 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2464 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2464 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2464 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34374] The complementary binding of GAM2464 RNA, herein designated GAM RNA, to target binding sites on GAM2464 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2464 target RNA, herein designated GAM TARGET RNA, into GAM2464 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34375] It is appreciated that GAM2464 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2464 target genes. The mRNA of each one of this plurality of GAM2464 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2464 RNA, herein designated GAM RNA, and which when bound by GAM2464 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2464 target proteins.

[34376] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2464 gene, herein designated GAM GENE, on one or more GAM2464 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34377] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2464 correlate with, and may be deduced from, the identity of the target genes which GAM2464 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34378] Nucleotide sequences of the GAM2464 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2464 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2464 are further described hereinbelow with reference to Table 1.

[34379] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2464 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34380] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2465 (GAM2465) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34381] GAM2465 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2465 was detected is described hereinabove with reference to Figs. 2-8.

[34382] GAM2465 gene, herein designated GAM GENE, and GAM2465 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34383] GAM2465 gene, herein designated GAM GENE, encodes a GAM2465 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2465 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2465 precursor RNA is designated SEQ ID:2442, and is provided hereinbelow with reference to the sequence listing part.

[34384] GAM2465 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34385] An enzyme complex designated DICER COMPLEX, dices the GAM2465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2465 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2465 RNA is designated SEQ ID:5056, and is provided hereinbelow with reference to the sequence listing part.

[34386] GAM2465 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2465 target RNA, herein designated GAM TARGET RNA. GAM2465 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34387] GAM2465 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2465 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2465 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2465 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2465 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34388] The complementary binding of GAM2465 RNA, herein designated GAM RNA, to target binding sites on GAM2465 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2465 target RNA, herein designated GAM TARGET RNA, into GAM2465 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34389] It is appreciated that GAM2465 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2465 target genes. The

mRNA of each one of this plurality of GAM2465 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2465 RNA, herein designated GAM RNA, and which when bound by GAM2465 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2465 target proteins.

[34390] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2465 gene, herein designated GAM GENE, on one or more GAM2465 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34391] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2465 correlate with, and may be deduced from, the identity of the target genes which GAM2465 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34392] Nucleotide sequences of the GAM2465 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2465 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2465 are further described hereinbelow with reference to Table 1.

[34393] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2465 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34394] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2466 (GAM2466) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34395] GAM2466 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2466 was detected is described hereinabove with reference to Figs. 2-8.

[34396] GAM2466 gene, herein designated GAM GENE, and GAM2466 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34397] GAM2466 gene, herein designated GAM GENE, encodes a GAM2466 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2466 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2466 precursor RNA is designated SEQ ID:2443, and is provided hereinbelow with reference to the sequence listing part.

[34398] GAM2466 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34399] An enzyme complex designated DICER COMPLEX, dices the GAM2466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2466 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2466 RNA is designated SEQ ID:5058, and is provided hereinbelow with reference to the sequence listing part.

[34400] GAM2466 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2466 target RNA, herein designated GAM TARGET RNA. GAM2466 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34401] GAM2466 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2466 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2466 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2466 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2466 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34402] The complementary binding of GAM2466 RNA, herein designated GAM RNA, to target binding sites on GAM2466 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2466 target RNA, herein designated GAM TARGET RNA, into GAM2466 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34403] It is appreciated that GAM2466 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2466 target genes. The mRNA of each one of this plurality of GAM2466 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2466 RNA, herein designated GAM RNA, and which when bound by GAM2466 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2466 target proteins.

[34404] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2466 gene, herein designated GAM GENE, on one or more GAM2466 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34405] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2466 correlate with, and may be deduced from, the identity of the target

genes which GAM2466 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34406] Nucleotide sequences of the GAM2466 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2466 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2466 are further described hereinbelow with reference to Table 1.

[34407] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2466 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34408] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2467 (GAM2467) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34409] GAM2467 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2467 was detected is described hereinabove with reference to Figs. 2-8.

[34410] GAM2467 gene, herein designated GAM GENE, and GAM2467 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[34411] GAM2467 gene, herein designated GAM GENE, encodes a GAM2467 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2467 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2467 precursor RNA is designated SEQ ID:2444, and is provided hereinbelow with reference to the sequence listing part.

[34412] GAM2467 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34413] An enzyme complex designated DICER COMPLEX, dices the GAM2467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2467 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2467 RNA is designated SEQ ID:5057, and is provided

hereinbelow with reference to the sequence listing part.

[34414] GAM2467 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2467 target RNA, herein designated GAM TARGET RNA. GAM2467 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34415] GAM2467 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2467 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2467 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2467 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2467 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34416] The complementary binding of GAM2467 RNA, herein designated GAM RNA, to target binding sites on GAM2467 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2467 target RNA, herein designated GAM TARGET RNA, into GAM2467 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34417] It is appreciated that GAM2467 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2467 target genes. The mRNA of each one of this plurality of GAM2467 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2467 RNA, herein designated GAM RNA, and which when bound by GAM2467 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2467 target proteins.

[34418] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2467 gene, herein designated GAM GENE, on one or more GAM2467 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34419] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2467 correlate with, and may be deduced from, the identity of the target genes which GAM2467 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34420] Nucleotide sequences of the GAM2467 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2467 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2467 are further described hereinbelow with reference to Table 1.

[34421] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2467 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34422] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2468 (GAM2468) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34423] GAM2468 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2468 was detected is described hereinabove with reference to Figs. 2-8.

[34424] GAM2468 gene, herein designated GAM GENE, and GAM2468 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34425] GAM2468 gene, herein designated GAM GENE, encodes a GAM2468 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2468 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2468 precursor RNA is designated SEQ ID:2445, and is provided hereinbelow with reference to the sequence listing part.

[34426] GAM2468 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2468 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34427] An enzyme complex designated DICER COMPLEX, dices the GAM2468 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2468 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM2468 RNA is designated SEQ ID:5059, and is provided hereinbelow with reference to the sequence listing part.

[34428] GAM2468 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2468 target RNA, herein designated GAM TARGET RNA. GAM2468 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34429] GAM2468 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2468 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2468 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2468 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2468 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34430] The complementary binding of GAM2468 RNA, herein designated GAM RNA, to target binding sites on GAM2468 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2468 target RNA, herein designated GAM TARGET RNA, into GAM2468 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34431] It is appreciated that GAM2468 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2468 target genes. The mRNA of each one of this plurality of GAM2468 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2468 RNA, herein designated GAM RNA, and which when bound by GAM2468 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2468 target proteins.

[34432] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2468 gene, herein designated GAM GENE, on one or more GAM2468 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34433] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2468 correlate with, and may be deduced from, the identity of the target genes which GAM2468 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34434] Nucleotide sequences of the GAM2468 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2468 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2468 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2468 are further described hereinbelow with reference to Table 1.

[34435] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2468 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34436] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2469 (GAM2469) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [34437] GAM2469 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2469 was detected is described hereinabove with reference to Figs. 2-8.
- [34438] GAM2469 gene, herein designated GAM GENE, and GAM2469 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34439] GAM2469 gene, herein designated GAM GENE, encodes a GAM2469 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2469 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2469 precursor RNA is designated SEQ ID:2446, and is provided hereinbelow with reference to the sequence listing part.
- [34440] GAM2469 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [34441] An enzyme complex designated DICER COMPLEX, dices the GAM2469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2469 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2469 RNA is designated SEQ ID:5060, and is provided hereinbelow with reference to the sequence listing part.
- [34442] GAM2469 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2469 target RNA, herein designated GAM TARGET RNA. GAM2469 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [34443] GAM2469 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2469 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2469 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2469 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2469 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34444] The complementary binding of GAM2469 RNA, herein designated GAM RNA, to target binding sites on GAM2469 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2469 target RNA, herein designated GAM TARGET RNA, into GAM2469 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34445] It is appreciated that GAM2469 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2469 target genes. The mRNA of each one of this plurality of GAM2469 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2469 RNA, herein designated GAM RNA, and which when bound by GAM2469 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2469 target proteins.

[34446] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2469 gene, herein designated GAM GENE, on one or more GAM2469 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34447] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2469 correlate with, and may be deduced from, the identity of the target genes which GAM2469 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34448] Nucleotide sequences of the GAM2469 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2469 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2469 are further described hereinbelow with reference to Table 1.

[34449] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2469 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[34450] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2470 (GAM2470) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34451] GAM2470 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2470 was detected is described hereinabove with reference to Figs. 2-8.

[34452] GAM2470 gene, herein designated GAM GENE, and GAM2470 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34453] GAM2470 gene, herein designated GAM GENE, encodes a GAM2470 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2470 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2470 precursor RNA is designated SEQ ID:2447, and is provided hereinbelow with reference to the sequence listing part.

[34454] GAM2470 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34455] An enzyme complex designated DICER COMPLEX, dices the GAM2470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2470 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2470 RNA is designated SEQ ID:5061, and is provided hereinbelow with reference to the sequence listing part.

[34456] GAM2470 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2470 target RNA, herein designated GAM TARGET RNA. GAM2470 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34457] GAM2470 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2470 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2470 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2470 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2470 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34458] The complementary binding of GAM2470 RNA, herein designated GAM RNA, to target binding sites on GAM2470 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2470 target RNA, herein designated GAM TARGET RNA, into GAM2470 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34459] It is appreciated that GAM2470 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2470 target genes. The mRNA of each one of this plurality of GAM2470 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2470 RNA, herein designated GAM RNA, and which when bound by GAM2470 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2470 target proteins.

[34460] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2470 gene, herein designated GAM GENE, on one or more GAM2470 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34461] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2470 correlate with, and may be deduced from, the identity of the target genes which GAM2470 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34462] Nucleotide sequences of the GAM2470 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2470 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2470 are further described hereinbelow with reference to Table 1.

- [34463] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2470 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [34464] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2471 (GAM2471) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [34465] GAM2471 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2471 was detected is described hereinabove with reference to Figs. 2-8.
- [34466] GAM2471 gene, herein designated GAM GENE, and GAM2471 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34467] GAM2471 gene, herein designated GAM GENE, encodes a GAM2471 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2471 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2471 precursor RNA is designated SEQ ID:2448, and is provided hereinbelow with reference to the sequence listing part.

[34468] GAM2471 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2471 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34469] An enzyme complex designated DICER COMPLEX, dices the GAM2471 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2471 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2471 RNA is designated SEQ ID:5062, and is provided hereinbelow with reference to the sequence listing part.

[34470] GAM2471 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2471 target RNA, herein designated GAM TARGET RNA. GAM2471 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34471] GAM2471 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2471 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2471 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2471 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2471 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34472] The complementary binding of GAM2471 RNA, herein designated GAM RNA, to target binding sites on GAM2471 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2471 target RNA, herein designated GAM TARGET RNA, into GAM2471 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34473] It is appreciated that GAM2471 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2471 target genes. The

mRNA of each one of this plurality of GAM2471 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2471 RNA, herein designated GAM RNA, and which when bound by GAM2471 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2471 target proteins.

[34474] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2471 gene, herein designated GAM GENE, on one or more GAM2471 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34475] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2471 correlate with, and may be deduced from, the identity of the target genes which GAM2471 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34476] Nucleotide sequences of the GAM2471 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2471 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2471 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2471 are further described hereinbelow with reference to Table 1.

[34477] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2471 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34478] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2472 (GAM2472) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34479] GAM2472 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2472 was detected is described hereinabove with reference to Figs. 2-8.

[34480] GAM2472 gene, herein designated GAM GENE, and GAM2472 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34481] GAM2472 gene, herein designated GAM GENE, encodes a GAM2472 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2472 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2472 precursor RNA is designated SEQ ID:2449, and is provided hereinbelow with reference to the sequence listing part.

[34482] GAM2472 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34483] An enzyme complex designated DICER COMPLEX, dices the GAM2472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2472 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2472 RNA is designated SEQ ID:5063, and is provided hereinbelow with reference to the sequence listing part.

[34484] GAM2472 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2472 target RNA, herein designated GAM TARGET RNA. GAM2472 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34485] GAM2472 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2472 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2472 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2472 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2472 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34486] The complementary binding of GAM2472 RNA, herein designated GAM RNA, to target binding sites on GAM2472 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2472 target RNA, herein designated GAM TARGET RNA, into GAM2472 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34487] It is appreciated that GAM2472 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2472 target genes. The mRNA of each one of this plurality of GAM2472 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2472 RNA, herein designated GAM RNA, and which when bound by GAM2472 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2472 target proteins.

[34488] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2472 gene, herein designated GAM GENE, on one or more GAM2472 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34489] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2472 correlate with, and may be deduced from, the identity of the target

genes which GAM2472 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34490] Nucleotide sequences of the GAM2472 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2472 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2472 are further described hereinbelow with reference to Table 1.

[34491] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2472 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34492] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2473 (GAM2473) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34493] GAM2473 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2473 was detected is described hereinabove with reference to Figs. 2-8.

[34494] GAM2473 gene, herein designated GAM GENE, and GAM2473 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[34495] GAM2473 gene, herein designated GAM GENE, encodes a GAM2473 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2473 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2473 precursor RNA is designated SEQ ID:2450, and is provided hereinbelow with reference to the sequence listing part.

[34496] GAM2473 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34497] An enzyme complex designated DICER COMPLEX, dices the GAM2473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2473 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2473 RNA is designated SEQ ID:5064, and is provided

hereinbelow with reference to the sequence listing part.

[34498] GAM2473 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2473 target RNA, herein designated GAM TARGET RNA. GAM2473 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34499] GAM2473 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2473 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2473 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2473 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2473 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34500] The complementary binding of GAM2473 RNA, herein designated GAM RNA, to target binding sites on GAM2473 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2473 target RNA, herein designated GAM TARGET RNA, into GAM2473 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34501] It is appreciated that GAM2473 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2473 target genes. The mRNA of each one of this plurality of GAM2473 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2473 RNA, herein designated GAM RNA, and which when bound by GAM2473 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2473 target proteins.

[34502] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2473 gene, herein designated GAM GENE, on one or more GAM2473 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34503] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2473 correlate with, and may be deduced from, the identity of the target genes which GAM2473 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34504] Nucleotide sequences of the GAM2473 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2473 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2473 are further described hereinbelow with reference to Table 1.

[34505] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2473 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34506] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2474 (GAM2474) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34507] GAM2474 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2474 was detected is described hereinabove with reference to Figs. 2-8.

[34508] GAM2474 gene, herein designated GAM GENE, and GAM2474 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34509] GAM2474 gene, herein designated GAM GENE, encodes a GAM2474 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2474 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2474 precursor RNA is designated SEQ ID:2451, and is provided hereinbelow with reference to the sequence listing part.

[34510] GAM2474 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34511] An enzyme complex designated DICER COMPLEX, dices the GAM2474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2474 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2474 RNA is designated SEQ ID:5065, and is provided hereinbelow with reference to the sequence listing part.

[34512] GAM2474 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2474 target RNA, herein designated GAM TARGET RNA. GAM2474 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34513] GAM2474 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2474 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2474 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2474 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2474 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34514] The complementary binding of GAM2474 RNA, herein designated GAM RNA, to target binding sites on GAM2474 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2474 target RNA, herein designated GAM TARGET RNA, into GAM2474 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34515] It is appreciated that GAM2474 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2474 target genes. The mRNA of each one of this plurality of GAM2474 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2474 RNA, herein designated GAM RNA, and which when bound by GAM2474 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2474 target proteins.

[34516] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2474 gene, herein designated GAM GENE, on one or more GAM2474 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34517] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2474 correlate with, and may be deduced from, the identity of the target genes which GAM2474 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34518] Nucleotide sequences of the GAM2474 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2474 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2474 are further described hereinbelow with reference to Table 1.

[34519] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2474 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34520] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2475 (GAM2475) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34521] GAM2475 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2475 was detected is described hereinabove with reference to Figs. 2-8.

[34522] GAM2475 gene, herein designated GAM GENE, and GAM2475 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34523] GAM2475 gene, herein designated GAM GENE, encodes a GAM2475 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2475 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2475 precursor RNA is designated SEQ ID:2452, and is provided hereinbelow with reference to the sequence listing part.

[34524] GAM2475 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [34525] An enzyme complex designated DICER COMPLEX, dices the GAM2475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2475 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2475 RNA is designated SEQ ID:5066, and is provided hereinbelow with reference to the sequence listing part.
- [34526] GAM2475 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2475 target RNA, herein designated GAM TARGET RNA. GAM2475 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [34527] GAM2475 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2475 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2475 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2475 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2475 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34528] The complementary binding of GAM2475 RNA, herein designated GAM RNA, to target binding sites on GAM2475 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2475 target RNA, herein designated GAM TARGET RNA, into GAM2475 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34529] It is appreciated that GAM2475 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2475 target genes. The mRNA of each one of this plurality of GAM2475 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2475 RNA, herein designated GAM RNA, and which when bound by GAM2475 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2475 target proteins.

[34530] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2475 gene, herein designated GAM GENE, on one or more GAM2475 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34531] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2475 correlate with, and may be deduced from, the identity of the target genes which GAM2475 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34532] Nucleotide sequences of the GAM2475 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2475 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2475 are further described hereinbelow with reference to Table 1.

[34533] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2475 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[34534] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2476 (GAM2476) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34535] GAM2476 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2476 was detected is described hereinabove with reference to Figs. 2-8.

[34536] GAM2476 gene, herein designated GAM GENE, and GAM2476 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34537] GAM2476 gene, herein designated GAM GENE, encodes a GAM2476 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2476 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2476 precursor RNA is designated SEQ ID:2453, and is provided hereinbelow with reference to the sequence listing part.

[34538] GAM2476 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34539] An enzyme complex designated DICER COMPLEX, dices the GAM2476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2476 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2476 RNA is designated SEQ ID:5067, and is provided hereinbelow with reference to the sequence listing part.

[34540] GAM2476 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2476 target RNA, herein designated GAM TARGET RNA. GAM2476 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34541] GAM2476 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2476 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2476 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2476 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2476 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34542] The complementary binding of GAM2476 RNA, herein designated GAM RNA, to target binding sites on GAM2476 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2476 target RNA, herein designated GAM TARGET RNA, into GAM2476 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34543] It is appreciated that GAM2476 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2476 target genes. The mRNA of each one of this plurality of GAM2476 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2476 RNA, herein designated GAM RNA, and which when bound by GAM2476 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2476 target proteins.

[34544] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2476 gene, herein designated GAM GENE, on one or more GAM2476 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34545] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2476 correlate with, and may be deduced from, the identity of the target genes which GAM2476 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34546] Nucleotide sequences of the GAM2476 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2476 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2476 are further described hereinbelow with reference to Table 1.

- [34547] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2476 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [34548] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2477 (GAM2477) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [34549] GAM2477 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2477 was detected is described hereinabove with reference to Figs. 2-8.
- [34550] GAM2477 gene, herein designated GAM GENE, and GAM2477 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34551] GAM2477 gene, herein designated GAM GENE, encodes a GAM2477 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2477 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2477 precursor RNA is designated SEQ ID:2454, and is provided hereinbelow with reference to the sequence listing part.

[34552] GAM2477 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34553] An enzyme complex designated DICER COMPLEX, dices the GAM2477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2477 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2477 RNA is designated SEQ ID:5068, and is provided hereinbelow with reference to the sequence listing part.

[34554] GAM2477 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2477 target RNA, herein designated GAM TARGET RNA. GAM2477 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34555] GAM2477 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2477 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2477 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2477 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2477 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34556] The complementary binding of GAM2477 RNA, herein designated GAM RNA, to target binding sites on GAM2477 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2477 target RNA, herein designated GAM TARGET RNA, into GAM2477 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34557] It is appreciated that GAM2477 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2477 target genes. The

mRNA of each one of this plurality of GAM2477 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2477 RNA, herein designated GAM RNA, and which when bound by GAM2477 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2477 target proteins.

[34558] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2477 gene, herein designated GAM GENE, on one or more GAM2477 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34559] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2477 correlate with, and may be deduced from, the identity of the target genes which GAM2477 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34560] Nucleotide sequences of the GAM2477 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2477 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2477 are further described hereinbelow with reference to Table 1.

[34561] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2477 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34562] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2478 (GAM2478) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34563] GAM2478 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2478 was detected is described hereinabove with reference to Figs. 2-8.

[34564] GAM2478 gene, herein designated GAM GENE, and GAM2478 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34565] GAM2478 gene, herein designated GAM GENE, encodes a GAM2478 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2478 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2478 precursor RNA is designated SEQ ID:2455, and is provided hereinbelow with reference to the sequence listing part.

[34566] GAM2478 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34567] An enzyme complex designated DICER COMPLEX, dices the GAM2478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2478 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2478 RNA is designated SEQ ID:5070, and is provided hereinbelow with reference to the sequence listing part.

[34568] GAM2478 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2478 target RNA, herein designated GAM TARGET RNA. GAM2478 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34569] GAM2478 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2478 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2478 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2478 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2478 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34570] The complementary binding of GAM2478 RNA, herein designated GAM RNA, to target binding sites on GAM2478 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2478 target RNA, herein designated GAM TARGET RNA, into GAM2478 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34571] It is appreciated that GAM2478 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2478 target genes. The mRNA of each one of this plurality of GAM2478 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2478 RNA, herein designated GAM RNA, and which when bound by GAM2478 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2478 target proteins.

[34572] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2478 gene, herein designated GAM GENE, on one or more GAM2478 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34573] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2478 correlate with, and may be deduced from, the identity of the target

genes which GAM2478 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34574] Nucleotide sequences of the GAM2478 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2478 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2478 are further described hereinbelow with reference to Table 1.

[34575] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2478 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34576] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2479 (GAM2479) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34577] GAM2479 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2479 was detected is described hereinabove with reference to Figs. 2-8.

[34578] GAM2479 gene, herein designated GAM GENE, and GAM2479 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[34579] GAM2479 gene, herein designated GAM GENE, encodes a GAM2479 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2479 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2479 precursor RNA is designated SEQ ID:2456, and is provided hereinbelow with reference to the sequence listing part.

[34580] GAM2479 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34581] An enzyme complex designated DICER COMPLEX, dices the GAM2479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2479 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2479 RNA is designated SEQ ID:5069, and is provided

hereinbelow with reference to the sequence listing part.

[34582] GAM2479 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2479 target RNA, herein designated GAM TARGET RNA. GAM2479 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34583] GAM2479 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2479 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2479 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2479 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2479 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34584] The complementary binding of GAM2479 RNA, herein designated GAM RNA, to target binding sites on GAM2479 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2479 target RNA, herein designated GAM TARGET RNA, into GAM2479 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34585] It is appreciated that GAM2479 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2479 target genes. The mRNA of each one of this plurality of GAM2479 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2479 RNA, herein designated GAM RNA, and which when bound by GAM2479 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2479 target proteins.

[34586] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2479 gene, herein designated GAM GENE, on one or more GAM2479 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34587] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2479 correlate with, and may be deduced from, the identity of the target genes which GAM2479 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34588] Nucleotide sequences of the GAM2479 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2479 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2479 are further described hereinbelow with reference to Table 1.

[34589] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2479 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34590] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2480 (GAM2480) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34591] GAM2480 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2480 was detected is described hereinabove with reference to Figs. 2-8.

[34592] GAM2480 gene, herein designated GAM GENE, and GAM2480 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34593] GAM2480 gene, herein designated GAM GENE, encodes a GAM2480 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2480 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2480 precursor RNA is designated SEQ ID:2457, and is provided hereinbelow with reference to the sequence listing part.

[34594] GAM2480 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34595] An enzyme complex designated DICER COMPLEX, dices the GAM2480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2480 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2480 RNA is designated SEQ ID:5072, and is provided hereinbelow with reference to the sequence listing part.

[34596] GAM2480 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2480 target RNA, herein designated GAM TARGET RNA. GAM2480 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34597] GAM2480 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2480 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2480 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2480 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2480 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34598] The complementary binding of GAM2480 RNA, herein designated GAM RNA, to target binding sites on GAM2480 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2480 target RNA, herein designated GAM TARGET RNA, into GAM2480 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34599] It is appreciated that GAM2480 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2480 target genes. The mRNA of each one of this plurality of GAM2480 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2480 RNA, herein designated GAM RNA, and which when bound by GAM2480 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2480 target proteins.

[34600] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2480 gene, herein designated GAM GENE, on one or more GAM2480 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34601] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2480 correlate with, and may be deduced from, the identity of the target genes which GAM2480 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34602] Nucleotide sequences of the GAM2480 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2480 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2480 are further described hereinbelow with reference to Table 1.

[34603] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2480 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34604] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2481 (GAM2481) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [34605] GAM2481 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2481 was detected is described hereinabove with reference to Figs. 2-8.
- [34606] GAM2481 gene, herein designated GAM GENE, and GAM2481 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34607] GAM2481 gene, herein designated GAM GENE, encodes a GAM2481 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2481 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2481 precursor RNA is designated SEQ ID:2458, and is provided hereinbelow with reference to the sequence listing part.
- [34608] GAM2481 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [34609] An enzyme complex designated DICER COMPLEX, dices the GAM2481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2481 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2481 RNA is designated SEQ ID:5071, and is provided hereinbelow with reference to the sequence listing part.
- [34610] GAM2481 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2481 target RNA, herein designated GAM TARGET RNA. GAM2481 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [34611] GAM2481 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2481 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2481 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2481 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2481 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34612] The complementary binding of GAM2481 RNA, herein designated GAM RNA, to target binding sites on GAM2481 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2481 target RNA, herein designated GAM TARGET RNA, into GAM2481 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34613] It is appreciated that GAM2481 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2481 target genes. The mRNA of each one of this plurality of GAM2481 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2481 RNA, herein designated GAM RNA, and which when bound by GAM2481 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2481 target proteins.

[34614] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2481 gene, herein designated GAM GENE, on one or more GAM2481 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34615] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2481 correlate with, and may be deduced from, the identity of the target genes which GAM2481 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34616] Nucleotide sequences of the GAM2481 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2481 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2481 are further described hereinbelow with reference to Table 1.

[34617] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2481 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.
